Computational Intelligence - Volume II Hisao Ishibuchi, 2015-12-30 Computational intelligence is a component of Encyclopedia of Technology Information and Systems Management Resources in the global Encyclopedia of Life Support Systems EOLSS which is an integrated compendium of twenty one Encyclopedias Computational intelligence is a rapidly growing research field including a wide variety of problem solving techniques inspired by nature Traditionally computational intelligence consists of three major research areas Neural Networks Fuzzy Systems and Evolutionary Computation Neural networks are mathematical models inspired by brains Neural networks have massively parallel network structures with many neurons and weighted connections Whereas each neuron has a simple input output relation a neural network with many neurons can realize a highly non linear complicated mapping Connection weights between neurons can be adjusted in an automated manner by a learning algorithm to realize a non linear mapping required in a particular application task Fuzzy systems are mathematical models proposed to handle inherent fuzziness in natural language For example it is very difficult to mathematically define the meaning of cold in everyday conversations such as It is cold today and Can I have cold water The meaning of cold may be different in a different situation Even in the same situation a different person may have a different meaning Fuzzy systems offer a mathematical mechanism to handle inherent fuzziness in natural language As a result fuzzy

systems have been successfully applied to real world problems by extracting linguistic knowledge from human experts in the form of fuzzy IF THEN rules Evolutionary computation includes various population based search algorithms inspired by evolution in nature Those algorithms usually have the following three mechanisms fitness evaluation to measure the quality of each solution selection to choose good solutions from the current population and variation operators to generate offspring from parents Evolutionary computation has high applicability to a wide range of optimization problems with different characteristics since it does not need any explicit mathematical formulations of objective functions For example simulation based fitness evaluation is often used in evolutionary design Subjective fitness evaluation by a human user is also often used in evolutionary art and music These volumes are aimed at the following five major target audiences University and College students Educators Professional practitioners Research personnel and Policy analysts managers and decision makers

Dini,2012-09 Plasticity establishes a permanent connectivity of the synapses in more rigid networks which when excited all will communicate together Elasticity maintains an instant connectivity between neural networks by bringing synapses in a suitable communication distance The other way of internal communication in brain is through the nerve fibers when two neural network configurations in a far distance can resonate together The integration of these types of communications is the mean that the brain functions Synaptic Plasticity Michel Baudry,Xiaoning Bi,Steven S. Organisation and Regulation G. A. Chauvet,1996-06-14 Organisation and Regulation **Emulation of Bursting Neurons in Neuromorphic Hardware based on Phase-Change Materials** Richard Meyes,2015-01-01 In the history of computing hardware Moore s law named after Intel co founder Gordon E Moore describes a long term trend whereby the number of transistors that can be placed inexpensively on an integrated circuit doubles approximately every two years 1 Because the number of transistors is crucial for computing performance significant performance gains could be achieved

simply through complementary metal oxide semiconductor CMOS transistor downscaling Although Moore's law which was mentioned for the first time in 1965 turned out to persist for almost five decades the nano era poses significant problems to the concept of downscaling 2 Upon approaching the size of atoms quantum effects such as quantum tunneling pose fundamental barriers to the trend Furthermore the conventional computing paradigm based on the Von Neumann architecture and binary logic becomes increasingly inefficient considering the growing complexity of today's computational tasks Hence new computational paradigms and alternative information processing architectures must be explored to extend the capabilities of future information technology beyond digital logic A fantastic example for such an alternative information processing architecture is the human brain The brain provides superior computational features such as ultrahigh density of processing units low energy consumption per computational event ultrahigh parallelism in computational execution extremely flexible plasticity of connections between processing units and fault tolerant computing provided by a huge number of computational entities Compared to today's programmable computers biological systems are six to nine orders of magnitude more efficient in complex environments 3 For instance simulating five seconds of brain activity takes IBM's state of the art supercomputer Blue Gene a hundred times as long i.e. 500 s during which it consumes 1.4 MW of power whereas the power dissipation in the human central nervous system is of the order of 10W 4 5 Thus it is not only extremely interesting but in terms of computational progress also highly desirable to understand how information is processed in the human brain The conceptual idea developed within the framework of this thesis tries to contribute to this intention In contrast to most recent research dealing with the simulation and emulation of specific connections between nerve cells 5 12 the work of this thesis focuses on investigating on *Psychiatry and Neuroscience Update - Vol. V* Pascual Ángel Gargiulo, Humberto Luis Mesones-Arroyo, 2024-12-28 This book offers a multidisciplinary approach to the phenomenon of addiction including a discussion of its anthropological neurological psychiatric and social aspects The editors have maintained this multidisciplinary criterion since the first volume of the Psychiatry and Neuroscience Update collection Approaching a topic from multiple points of view guides the mentality to open to biological and psychological relationships and facilitates translational extrapolations The ability to establish relationships closer or more distant but always binding is thus stimulated whether for study research or the interpretation of clinical reality As in previous volumes the book opens with a part dedicated to anthropological and philosophical aspects thus ensuring the validity of the humanistic aspect Intersubjectivity epistemological reflections the meaning of ecstasy and philosophical reflection leading to therapy are explored Part 2 From Basic Neurosciences to Human Brain presents a set of basic investigations with high translational content This corresponds with the editors intention to build bridges here between the basic and the clinical favoring the translational Chapters present topics of interest to both fields such as the neurobiology of addictions cocaine and benzodiazepines Part 3 establishes links between neurosciences learning teaching and the social environment It begins with a chapter on executive functioning

before discussing excessive use of computer technology and educational interventions for patients with alcohol addiction The fourth part of the book attempts to explain pathological human behavior It is about establishing links between brain disorders and diseases in the strict sense Among other topics chapters deal with cognitive dysfunction in addiction neuroimaging and stigma around substance use disorders Psychiatry and Neuroscience Update Addiction From Laboratory and Anthropology to Clinical Practice Vol V was edited and authored by a multidisciplinary group of authors and will be vital for an equally multidisciplinary group of readers psychiatrists psychologists neuroscientists and any other clinician or researcher that is interested in addictions Those in the humanities particularly anthropologists and philosophers will find the first part of great interest

Computational Neuroscience J.M. Bower,1999-07-08 This volume includes papers originally presented at the 7th annual Computational Neuroscience Meeting CNS 98 held in July of 1998 at the Fess Parker Doubletree Inn in Santa Barbara California The CNS meetings bring together computational neuroscientists representing many different fields and backgrounds as well as many different experimental preparations and theoretical approaches The papers published here range from pure experimental neurobiology to neuro ethology mathematics physics and engineering In all cases the research described is focused on understanding how nervous systems compute The actual subjects of the research include a highly diverse number of preparations modeling approaches and analysis techniques Accordingly this volume reflects the breadth and depth of current research in computational neuroscience taking place throughout the world
