

RADON MEASUREMENTS ETCHED TRACK DETECTORS

Radon is a radioactive gas that can cause lung cancer. It is produced by the decay of radium, which is found in soil and rock. Radon can enter buildings through cracks in the foundation or through pipes. It can also be released from water used for drinking or bathing.

Radon detectors are used to measure the amount of radon in the air. There are two main types of radon detectors: passive and active. Passive detectors are simple devices that collect radon over time and then measure its concentration. Active detectors use a pump to draw air through a filter, where the radon is collected and measured.
