Recent Progress in Electron Microscopy of Cells and Tissues Eichi Yamada, 1976 **Plasmodesmata: Recent Progress and New Insights** Jung-Youn Lee, Tessa Maureen Burch-Smith, Manfred Heinlein, 2022-04-25 **Ultrastructure of Endocrine Cells and Tissues** P. Motta, 2012-12-06

Innovative microscopic techniques introduced during the last two decades have contributed much to creating a new picture of the dynamic architecture of the cell which can now be more exactly correlated with specific biochemical and physiopathological events. These developments have led to significant advances in our understanding of the physiomorphological and pathological aspects of the secretory mechanism as well as the pharmacologic methods used to control experimentally the function of exocrine and endocrine glands. The integration of new ultrastructural methods such as freeze fracture etching immunocytochemistry scanning and high voltage electron microscopy cytoautoradiography etc has proven to be of great value when applied to the study of endocrine cells and tissues. Because information on this topic has appeared in a variety of scientific and medical journals this book 1 reviews the results of an integrative approach presenting a comprehensive ultrastructural account of the main aspects of the field 2 points out gaps or controversial topics in our knowledge and 3 outlines pertinent directions for future research. The chapters prepared by recognized authorities in the field present traditional information on the topic in a concise manner and with a valuable selection of original illustrations show what the integration of new microscopic methods can contribute to the subject in terms of new concepts. This volume will be useful to cell biologists anatomists embryologists histologists pharmacologists pathologists and of course endocrinologists. It will also be of interest to students practitioners of medicine and to all others dealing with clinical research and diagnosis.

Recent Progress in the Study and Therapy of Brain Edema K. Go, 2013-03-09

This issue contains the proceedings of the most recent International Symposium on Brain Edema the 5th in a series of conferences starting 1965 in Vienna. The ever since increasing interest in this field may not only result from the fact that in clinical terms the problem is not solved yet but also from the many fascinating physiological and biochemical questions remaining. Moreover the rapid progress of technical physiological and biochemical developments provides a permanent challenge to probe the subject with better and better resolution. The current proceedings provide many examples. It is safe to assume that the history of brain edema research is familiar to most of its participants. Therefore suffice it to remark that since the first histopathological recognition of brain edema as a separate entity among the multitude of intracranial space occupying lesions progress in the understanding of its pathogenesis has not been straightforward. On the contrary it has been complicated by confusing notions and concepts some of which may have resulted from the elusiveness of the edematous changes in early histological studies due to the inadequacy of the light microscope. Although brain edema occurs concomitantly in many pathological conditions of the brain it has been suggested that its role is collateral only. Nevertheless the potential of brain edema as a space occupying lesion is not trivial since it raises intracranial pressure and eventually may result in lethal
