Recent Advances In Robot Learning:

Recent Advances in Robot Learning Judy A. Franklin, Tom M. Mitchell, Sebastian Thrun, 2012-12-06 Recent Advances in Robot Learning contains seven papers on robot learning written by leading researchers in the field As the selection of papers illustrates the field of robot learning is both active and diverse A variety of machine learning methods ranging from inductive logic programming to reinforcement learning is being applied to many subproblems in robot perception and control often with objectives as diverse as parameter calibration and concept formulation While no unified robot learning framework has yet emerged to cover the variety of problems and approaches described in these papers and other publications a clear set of shared issues underlies many robot learning problems Machine learning when applied to robotics is situated it is embedded into a real world system that tightly integrates perception decision making and execution Since robot learning involves decision making there is an inherent active learning issue Robotic domains are usually complex yet the expense of using actual robotic hardware often prohibits the collection of large amounts of training data Most robotic systems are real time systems Decisions must be made within critical or practical time constraints These characteristics present challenges and constraints to the learning system Since these characteristics are shared by other important real world application domains robotics is a highly attractive area for research on machine learning On the other hand machine learning is also highly attractive to robotics There is a great variety of open problems in robotics that defy a static hand coded solution Recent Advances in Robot Learning is an edited volume of peer reviewed original research comprising seven invited contributions by leading researchers This research work has also been published as a special issue of Machine Learning Volume 23 Numbers 2 and 3

Recent Advances in Robot Learning from Demonstration Harish Ravichandar, 2020 In the context of robotics and automation learning from demonstration LfD is the paradigm in which robots acquire new skills by learning to imitate an expert The choice of LfD over other robot learning methods is compelling when ideal behavior can be neither easily scripted as is done in traditional robot programming nor easily defined as an optimization problem but can be demonstrated While there have been multiple surveys of this field in the past there is a need for a new one given the considerable growth in the number of publications in recent years This review aims to provide an overview of the collection of machine learning methods used to enable a robot to learn from and imitate a teacher We focus on recent advancements in the field and present an updated taxonomy and characterization of existing methods We also discuss mature and emerging application areas for LfD and highlight the significant challenges that remain to be overcome both in theory and in practice
