

Biochemical analysis techniques of drugs

"Biochemical analysis techniques refer to a set of methods, assays, and procedures that enable(give a power) scientists to analyze the substances found in living organisms and the chemical reactions underlying life processes."

To perform biochemical analysis of a biomolecule in a biological system, there is a need to design a strategy to detect the biomolecule & isolate it in pure form.

BIOMOLECULES:

A biomolecule is any molecule that is produced by a living organism, including large macromolecules such as proteins, polysaccharides, lipids, and nucleic acids, as well as small molecules such as primary metabolites and natural products.

Types of biomolecules

- Lipids,protein, polysaccharides, glycolipids, sterols, glycerolipids
- Vitamins
- Hormones, neurotransmitters
- Metabolites
- Monomers, oligomers and polymers

Most biomolecules occur in minute amounts in the cell, and for their detection and analysis it is required to purify them from any contamination. The methods for purification of biomolecules includes simple precipitation, centrifugation, and gel electrophoresis, chromatographic and affinity techniques.
