

What Is The Principle Of Operation Of A Radio Transmitter And Receiver?

- Radio communication is central to modern technology, with radio transmitters and receivers facilitating the exchange of information over vast distances
- The transmitter generates a signal, modulates it onto a carrier wave, amplifies it, and sends it via an antenna
- The receiver captures the transmitted waves with its antenna, amplifies the weak signal, demodulates it to extract the original information, and processes it for output
- This system of signal generation, modulation, amplification, and demodulation enables efficient, long-range communication
