Mass Transfer And Kinetics Of Ion Exchange:

Mass Transfer and Kinetics of Ion Exchange L. Liberti, F.G. Helfferich, 2012-12-06 While ion exchange processes were originally used for the treatment of very dilute solutions many applications for the treatment of concentrated solutions have been developed in recent years In these situations the mass transfer bottlenecks are located in the solid rather than the liquid phase Therefore the development of quantitative models for ion exchange kinetics requires knowledge about the conductance characteristics of ions and solvent in the solid phase A useful approach towards this aim is the study of transport characteristics of these species and of their interactions in solid ion exchange membranes Many different transport processes and related phenomena can be observed in membrane solution systems e.g. ion migration, electroosmosis, diffusion, self-diffusion, osmosis, hydraulic flow, hyperfiltration, reverse osmosis or ultrafiltration, streaming potential and streaming current and membrane potentials also called membrane concentration potentials It is important to correlate all these phenomena so as to avoid a very large number of unnecessary measurements Such correlation is often possible Meares 1976 since all these phenomena are determined by the ease of migration of the different species across the membrane Important correlations have been made and summarized even before high capacity ion exchange membranes became commercially available Sollner 1950 1971j

Advances in Soil Science, 2012-12-06 The world needs for food and fiber continue to increase Population growth in the developing countries peaked at 2.4 percent a year in 1965 and has fallen to about 2.1 percent However in many developing countries almost half the people are under 15 years of age poised to enter their productive and reproductive years The challenges to produce enough food for this growing population will remain great Even more challenging is growing the food in the areas of greatest need Presently the world has great surpluses of food and fiber in some areas while there are devastating deficiencies in other areas Economic conditions and the lack of suitable infrastructure for distribution all too often limit the alleviation of hunger even when there are adequate supplies sometimes even within the country itself World hunger can only be solved in the long run by increasing crop production in the areas where the population is growing most rapidly This will require increased efforts of both the developed and developing countries Much of the technology that is so successful for crop production in the developed countries cannot be utilized directly in the developing countries Many of the principles however can and must be adapted to the conditions both physical and economic of the developing countries This series *Advances in Soil Science*
