Nature Experiment And The Sciences:

Nature, Experiment, and the Sciences Trevor H. Levere, W.R. Shea, 2012-12-06 This collection of essays is a tribute to Stillman Drake by some of his friends and colleagues and by others on whom his work has had a formative influence. It is difficult to know him without succumbing to his combination of discipline and enthusiasm even in fields remote from Renaissance physics and natural philosophy and so he should not be surprised in this volume to see emphases and methods congenial to him even on topics as remote as Darwin or the chemical revolution. Therein lies whatever unity the discerning reader may find in this book beyond the natural focus and coherence of the largest section on Galileo and the final section on Drake's collection of books, a major and now accessible resource for research in the field that he has made his own. We have chosen as the occasion for presenting the volume to Stillman Drake Galileo's birthday. Galileo has had more than one birthday party in Toronto since Drake came to the University of Toronto. As for the title, it reflects a shared conviction that experiment is the key to science; it is what scientists do. Drake has already asserted that emphasis in the title of his magisterial *Galileo at Work* and we echo it here. Those who have had the privilege and pleasure of working and arguing with Stillman over the years know his tenacity, penetration and vigour. They also know his generosity and humility. We owe him much. *The Uses of Experiment* David Gooding, Trevor Pinch, Simon Schaffer, 1989-05-18 Experiment is widely regarded as the most distinctive feature of natural science and essential to the way scientists find out about the world. Yet there has been little study of the way scientists actually make and use experiments. *The Uses of Experiment* fills this gap in our knowledge about how science is practised. Presenting 14 original case studies of important and often famous experiments, the book asks the questions: What tools do experimenters use? How do scientists argue from experiments? What happens when an experiment is challenged? How do scientists check that their experiments are working? Are there differences between experiments in the physical sciences and technology? Leading scholars in the fields of history, sociology and philosophy of science consider topics such as the interaction of experiment, instruments and theory; accuracy and reliability as hallmarks of experiment in science and technology; realising new phenomena; the believability of experiments and the sort of knowledge they produce; and the wider contexts on which experimentalists draw to develop and win support for their work. Drawing on examples as diverse as Galilean mechanics, Victorian experiments on electricity, experiments on cloud formation and testing of nuclear missiles, a new view of experiment emerges. This view emphasises that experiments always involve choice, tactics and strategy in persuading audiences that Nature resembles the picture experimenters create. *Natural Experiments in the Social Sciences* Thad Dunning, 2012-09-06 The first comprehensive guide to natural experiments, providing an ideal introduction for scholars and students. **Observation and Experiment in the Natural and Social Sciences** Maria Carla Galavotti, 2006-04-18 According to a long tradition in philosophy of science, a clear cut distinction can be traced between a context of discovery and a context of justification. This tradition dates back to the birth of the discipline in connection with the Circles of Vienna and

Berlin in the twenties and thirties of last century. Convicted that only the context of justification is pertinent to philosophy of science, logical empiricists identified its goal with the rational reconstruction of scientific knowledge taken as the clarification of the logical structure of science through an analysis of its language and methods. Stressing justification as the proper field of application of philosophy of science, logical empiricists intended to leave discovery out of its remit. The context of discovery was then discarded from philosophy of science and left to sociology, psychology and history. The distinction between context of discovery and context of justification goes hand in hand with the tenet that the theoretical side of science can and should be kept separate from its observational and experimental components. Further, the final abstract formulation of theories should be analysed apart from the process behind it, resulting from a tangle of context-dependent factors. This conviction is reflected by the distinction between theoretical and observational sentences underpinning the Hempelian view of theories as nets whose knots represent theoretical terms floating on the plane of observation to which it is anchored by rules of interpretation.

Advances in Experimental Political Science James N. Druckman, Donald P. Green, 2021-04. Novel collection of essays addressing contemporary trends in political science covering a broad array of methodological and substantive topics.

Nature's Experiments and the Search for Symbolist Form Allison Morehead, 2017-02-27. This provocative study argues that some of the most inventive artwork of the 1890s was strongly influenced by the methods of experimental science and ultimately foreshadowed twentieth-century modernist practices. Looking at avant-garde figures such as Maurice Denis, Douard Vuillard, August Strindberg, and Edvard Munch, Allison Morehead considers the conjunction of art-making and experimentalism to illuminate how artists echoed the spirit of an increasingly explorative scientific culture in their work and processes. She shows how the concept of nature's experiments—the belief that the study of pathologies led to an understanding of scientific truths—above all about the human mind and body extended from the scientific realm into the world of art, underpinning artists' solutions to the problem of symbolist form and providing a ready-made methodology for fin de siècle truth-seekers. By using experimental methods to transform symbolist theories into visual form, these artists broke from naturalist modes and interrogated concepts such as deformation, automatism, the arabesque, and madness to create modern works that were radically and usefully strange. Focusing on the scientific, psychological, and experimental tactics of symbolism, *Nature's Experiments and the Search for Symbolist Form* demystifies the avant-garde value of experimentation and reveals new and important insights into a foundational period for the development of European modernism.

The Value and Valuation of Natural Science Collections John R. Nudds, Charles William Pettitt, 1997. *Six-minute Nature Experiments* Faith Hickman Brynie, 1999. Provides instructions for simple science experiments using everyday materials to explore weight, water, heat, and chemistry, motion, botany, and the sun.

Experiment and Natural Philosophy in Seventeenth-Century Tuscany Luciano Boschiero, 2007-09-04. The aim of this book is to explore and understand the activities undertaken by the Florentine Accademia del Cimento, one of Europe's first scientific societies. The Cimento operated for ten

years between 1657 and 1667 and during that time performed many experiments and observations in physics and astronomy rivalling the achievements of the Royal Society of London and the Parisian Académie Royale des Sciences This book will attempt to sift through the available primary evidence as well as secondary accounts of the Cimento's activities in order to examine the intellectual concerns that the individual academicians acquired throughout their careers and that they pursued while carrying out and interpreting their experiments for the Cimento and the Tuscan Court Those interests will also shed some light on the ways in which the academicians performed and used experiments Inspired by Galileo's success with experiments and instruments during the first half of the seventeenth century the Cimento academicians developed an experimentalist approach to their natural inquiry that attempted to eliminate any dependence on theoretical presuppositions and preconceptions The group's purported aim was to rely solely on the senses to accumulate knowledge of nature This experimental philosophy framed the way in which historians have since viewed the Cimento's practices

Natural Experiments of History Jared Diamond, James A. Robinson, 2010 Some central questions in the natural and social sciences cannot be answered by controlled laboratory experiments often considered to be the hallmark of the scientific method This impossibility holds for any science concerned with the past In addition many manipulative experiments while possible would be considered immoral or illegal One has to devise other methods of observing describing and explaining the world In the historical disciplines a fruitful approach has been to use natural experiments or the comparative method This book consists of eight comparative studies drawn from history archeology economics economic history geography and political science The studies cover a spectrum of approaches ranging from a non quantitative narrative style in the early chapters to quantitative statistical analyses in the later chapters The studies range from a simple two way comparison of Haiti and the Dominican Republic which share the island of Hispaniola to comparisons of 81 Pacific islands and 233 areas of India The societies discussed are contemporary ones literate societies of recent centuries and non literate past societies Geographically they include the United States Mexico Brazil western Europe tropical Africa India Siberia Australia New Zealand and other Pacific islands In an Afterword the editors discuss how to cope with methodological problems common to these and other natural experiments of history
