**Engineering** James B. Kuo,Ker-Wei Su,1998-09-30 Silicon On Insulator SOI CMOS technology has been regarded as another

major technology for VLSI in addition to bulk CMOS technology. Owing to the buried oxide structure, SOI technology offers superior CMOS devices with higher speed, high density, and reduced second order effects for deep submicron, low voltage, low power VLSI circuits applications. In addition to VLSI applications and because of its outstanding properties, SOI technology has been used to realize communication circuits, microwave devices, BICMOS devices, and even fiber optics applications. CMOS VLSI Engineering: Silicon On Insulator addresses three key factors in engineering SOI CMOS VLSI processing: technology, device modelling, and circuit designs; all are covered with their mutual interactions. Starting from the SOI CMOS processing technology and the SOI CMOS digital and analog circuits, behaviors of the SOI CMOS devices are presented, followed by a CAD program, SPICE, which incorporates models for deep submicron, fully depleted, mesa isolated SOI CMOS devices and special purpose SOI devices, including polysilicon TFTs. CMOS VLSI Engineering: Silicon On Insulator is written for undergraduate senior students and first year graduate students interested in CMOS VLSI. It will also be suitable for electrical engineering professionals interested in microelectronics.

*Integrated Circuit and System Design* Enrico Macii, Vassilis Paliouras, Odysseas Koufopavlou, 2004-08-24. Welcome to the proceedings of PATMOS 2004, the fourteenth in a series of international workshops. PATMOS 2004 was organized by the University of Patras with technical co-sponsorship from the IEEE Circuits and Systems Society. Over the years, the PATMOS meeting has evolved into an important European event where industry and academia meet to discuss power and timing aspects in modern integrated circuit and system design. PATMOS provides a forum for researchers to discuss and investigate the emerging challenges in signal methodologies and tools required to develop the upcoming generations of integrated circuits and systems. We realized this vision this year by providing a technical program that contained state of the art technical contributions, a keynote speech, three invited talks, and two embedded tutorials. The technical program focused on timing, performance, and power consumption, as well as architectural aspects, with particular emphasis on modelling, design characterization, analysis, and optimization in the nanometer era. This year, a record 152 contributions were received to be considered for possible presentation at PATMOS. Despite the choice for an intense three day meeting, only 51 lecture papers and 34 poster papers could be accommodated in the single track technical program. The Technical Program Committee, with the assistance of additional expert reviewers, selected the 85 papers to be presented at PATMOS and organized them into 13 technical sessions. As was the case with the PATMOS workshops, the review process was anonymous; full papers were required, and several reviews were received per manuscript.

**Generalized Low-Voltage Circuit Techniques for Very High-Speed Time-Interleaved Analog-to-Digital Converters** Sai-Weng Sin, Seng-Pan U, Rui Paulo Martins, 2010-09-29

Analog to Digital Converters ADCs play an important role in most modern signal processing and wireless communication systems where extensive signal manipulation is necessary to be performed by complicated digital signal processing DSP circuitry. This trend also creates the possibility of fabricating all functional blocks of a system in a single chip System On Chip SoC with great reductions in cost, chip area and power consumption. However, this tendency places an increasing challenge in terms of speed, resolution, power consumption and noise performance in the design of the front end ADC, which is usually the bottleneck of the whole system, especially under the unavoidable low supply voltage imposed by technology scaling as well as the requirement of battery operated portable devices. Generalized Low Voltage Circuit Techniques for Very High Speed Time Interleaved Analog to Digital Converters will present new techniques tailored for low voltage and high speed Switched Capacitor SC ADC with various design specific considerations.

Highly Linear Integrated Wideband Amplifiers Henrik Sjöland,2012-12-06

Highly Linear Integrated Wideband Amplifiers Design and Analysis Techniques for Frequencies from Audio to RF deals with the complicated issues involved in the design of high linearity integrated wideband amplifiers for different operating frequencies The book demonstrates these principles using a number of high performance designs New topologies for high linearity are presented as well as a novel method for estimating the intermodulation distortion of a wideband signal One of the most exciting results presented is an enhanced feedback configuration called feedback boosting that is capable of very low distortion Also important is a statistical method for relating the intermodulation distortion of a wideband signal to the total harmonic distortion THD of a single tone The THD as opposed to the intermodulation distortion of the wideband signal is easy to measure and use as a design parameter Three different applications where high linearity is needed are identified namely audio power amplifiers wideband IF amplifiers and RF power amplifiers For these applications high performance integrated amplifier designs using novel topologies are presented together with measurement results The audio amplifiers are built in CMOS and are capable of driving 8Ω loudspeaker loads directly without using any external components One of the designs can operate on a supply voltage down to 1.5V Both bipolar and CMOS wideband IF amplifiers are built they are fully differential and have linearity from DC to 20 MHz Finally an RF power amplifier is built in CMOS without using inductors in order to investigate what performance can be achieved without them
