Numerical Techniques for Stochastic Optimization Yuri Ermoliev, Roger J.-B. Wets, 1988 Rapid changes in today's environment emphasize the need for models and methods capable of dealing with the uncertainty inherent in virtually all systems related to economics meteorology demography ecology etc Systems involving interactions between man nature and technology are subject to disturbances which may be unlike anything which has been experienced in the past In the technological revolution increases uncertainty as each new stage particular perturbs existing knowledge of structures limitations and constraints At the same time many systems are often too complex to allow for precise measurement of the parameters or the state of the system Uncertainty nonstationarity disequilibrium are pervasive characteristics of most modern systems In order to manage such situations or to survive in such an environment we must develop systems which can facilitate our response to uncertainty and changing conditions In our individual behavior we often follow guidelines that are conditioned by the need to be prepared for all likely eventualities insurance wearing seat belts savings versus investments annual medical check ups even keeping an umbrella at the office etc One can identify two major types of mechanisms the short term adaptive adjustments defensive driving marketing inventory control etc that are made after making some observations of the system's parameters and the long term anticipative actions engineering design policy setting allocation of resources investment strategies etc

Kall, 2013-12-14 In order to obtain more reliable optimal solutions of concrete technical economic problems e.g. optimal design problems the often known stochastic variations of many technical economic parameters have to be taken into account already in the planning phase Hence ordinary mathematical programs have to be replaced by appropriate stochastic programs New theoretical insight into several branches of reliability oriented optimization of stochastic systems new computational approaches and technical economic applications of stochastic programming methods can be found in this volume

Stochastic Optimization Kurt Marti, 2012-12-06 This volume includes a selection of refereed papers presented at the GAMM IFIP Workshop on Stochastic Optimization Numerical Methods and Technical Applications held at the Federal Armed Forces University Munich May 29-31 1990 The objective of this meeting was to bring together scientists from Stochastic Programming and from those Engineering areas where Mathematical Programming models are common tools as e.g. Optimal Structural Design Power Dispatch Acid Rain Management etc The first theoretical part includes the papers by S.D. Flam H. Niederreiter E. Poechinger and R. Schultz The second part on methods and applications contains the articles by N.

Dantzig George Bernard Dantzig, Richard Cottle, 2003 The late George B Dantzig widely known as the father of linear programming was a major influence in mathematics operations research and economics As Professor Emeritus at Stanford University he continued his decades of research on linear programming and related subjects Dantzig was awarded eight honorary doctorates the National Medal of Science and the John von Neumann Theory Prize from the Institute for Operations Research and the Management Sciences The 24 chapters of this volume highlight the amazing breadth and enduring influence of Dantzig s research Short non technical summaries at the opening of each major section introduce a specific research area and discuss the current significance of Dantzig s work in that field Among the topics covered are mathematical statistics the Simplex Method of

linear programming economic modeling network optimization and nonlinear programming The book also includes a complete bibliography of Dantzig's writings

Managing Safety of Heterogeneous Systems Yuri Ermoliev, Marek Makowski, Kurt Marti, 2012-01-31 Managing safety of diverse systems requires decision making under uncertainties and risks Such systems are typically characterized by spatio-temporal heterogeneities inter dependencies externalities endogenous risks discontinuities irreversibility practically irreducible uncertainties and rare events with catastrophic consequences Traditional scientific approaches rely on data from real observations and experiments yet no sufficient observations exist for new problems and experiments are usually impossible Therefore science based support for addressing such new class of problems needs to replace the traditional deterministic predictions analysis by new methods and tools for designing decisions that are robust against the involved uncertainties and risks The new methods treat uncertainties explicitly by using synthetic information derived by integration of hard elements including available data results of possible experiments and formal representations of scientific facts with soft elements based on diverse representations of scenarios and opinions of public stakeholders and experts The volume presents such effective new methods and illustrates their applications in different problem areas including engineering economy finance agriculture environment and policy making

Operations Research and Decision Aid Methodologies in Traffic and Transportation Management Martine Labbe, Gilbert Laporte, Katalin Tanczos, Philippe Toint, 2013-06-29 Every one relies on some kind of transportation system nearly every day Go ing to work shopping dropping children at school and many other cultural or social activities imply leaving home and using some form of transportation which we expect to be efficient and reliable Of course efficiency and reliability do not occur by chance but require careful and often relatively complex planning by transportation system managers both in the public and private sectors It has long been recognized that mathematics and more specifically operations research is an important tool of this planning process However the range of skills required to cover both fields even partially is very large and the opportunities to gather people with this very diverse expertise are too few The organization of the NATO Advanced Studies Institute on Operations Research and Decision Aid Methodologies in Traffic and Transportation Management in March 1997 in Balatonfured Hungary was therefore more than welcome and the group of people that gathered for a very studious two weeks on the shores of the beautiful lake Balaton did really enjoy the truly multidisciplinary and high scientific level of the meeting The purpose of the present volume is to report in a chronological order the various questions that were considered by the lecturers and the students at the institute After a general introduction to the topic the first week focused on issues related to traffic modeling mostly in an urban context
