Multigrid Methods Stephen F. McCormick, 1987-12-01 A thoughtful consideration of the current level of development of multigrid methods this volume is a carefully edited collection of papers that addresses its topic on several levels The first three chapters orient the reader who is familiar with standard numerical techniques to multigrid methods first by discussing multigrid in the context of standard techniques second by detailing the mechanics of use of the method and third by applying the basic method to some current problems in fluid dynamics The fourth chapter provides a unified development complete with theory of algebraic multigrid AMG which is a linear equation solver based on multigrid principles The last chapter is an ambitious development of a very general theory of multigrid methods for variationally posed problems Included as an appendix is the latest edition of the Multigrid Bibliography an attempted compilation of all existing research publications on multigrid

Volume Set now available at special set price In one of the papers in this collection the remark that nothing at all takes place in the universe in which some rule of maximum of minimum does not appear is attributed to no less an authority than Euler Simplifying the syntax a little we might paraphrase this as Everything is an optimization problem While this might be

something of an overstatement the element of exaggeration is certainly reduced if we consider the extended form Everything is an optimization problem or a system of equations This observation even if only partly true stands as a fitting testimonial to the importance of the work covered by this volume Since the 1960s much effort has gone into the development and application of numerical algorithms for solving problems in the two areas of optimization and systems of equations As a result many different ideas have been proposed for dealing efficiently with for example severe nonlinearities and or very large numbers of variables Libraries of powerful software now embody the most successful of these ideas and one objective of this volume is to assist potential users in choosing appropriate software for the problems they need to solve More generally however these collected review articles are intended to provide both researchers and practitioners with snapshots of the state of the art with regard to algorithms for particular classes of problem These snapshots are meant to have the virtues of immediacy through the inclusion of very recent ideas but they also have sufficient depth of field to show how ideas have developed and how today's research questions have grown out of previous solution attempts The most efficient methods for local optimization both unconstrained and constrained are still derived from the classical Newton approach As well as dealing in depth with the various classical or neo classical approaches the selection of papers on optimization in this volume ensures that newer ideas are also well represented Solving nonlinear algebraic systems of equations is closely related to optimization The two are not completely equivalent however and usually something is lost in the translation Algorithms for nonlinear equations can be roughly classified as locally convergent or globally convergent The characterization is not perfect Locally convergent algorithms include Newton's method modern quasi Newton variants of Newton's method and trust region methods All of these approaches are well represented in this volume

The Total Least Squares Problem Sabine Van Huffel, Joos Vandewalle, 1991-01-01 This is the first book devoted entirely to total least squares The authors give a unified presentation of the TLS problem A description of its basic principles are given the various algebraic statistical and sensitivity properties of the problem are discussed and generalizations are presented Applications are surveyed to facilitate uses in an even wider range of applications Whenever possible comparison is made with the well known least squares methods A basic knowledge of numerical linear algebra matrix computations and some notion of elementary statistics is required of the reader however some background material is included to make the book reasonably self contained

Computational Solution of Nonlinear Systems of Equations Eugene L. Allgower, Kurt Georg, 1990-04-03 Nonlinear equations arise in essentially every branch of modern science engineering and mathematics However in only a very few special cases is it possible to obtain useful solutions to nonlinear equations via analytical calculations As a result many scientists resort to computational methods This book contains the proceedings of the Joint AMS SIAM Summer Seminar Computational Solution of Nonlinear Systems of Equations held in July 1988 at Colorado State University The aim of the book is to give a wide ranging survey of essentially all of the methods which comprise currently

active areas of research in the computational solution of systems of nonlinear equations A number of entry level survey papers were solicited and a series of test problems has been collected in an appendix Most of the articles are accessible to students who have had a course in numerical analysis

Optimization Algorithms on Matrix Manifolds P.-A. Absil, R. Mahony, Rodolphe Sepulchre, 2009-04-11 Many problems in the sciences and engineering can be rephrased as optimization problems on matrix search spaces endowed with a so called manifold structure This book shows how to exploit the special structure of such problems to develop efficient numerical algorithms It places careful emphasis on both the numerical formulation of the algorithm and its differential geometric abstraction illustrating how good algorithms draw equally from the insights of differential geometry optimization and numerical analysis Two more theoretical chapters provide readers with the background in differential geometry necessary to algorithmic development In the other chapters several well known optimization methods such as steepest descent and conjugate gradients are generalized to abstract manifolds The book provides a generic development of each of these methods building upon the material of the geometric chapters It then guides readers through the calculations that turn these geometrically formulated methods into concrete numerical algorithms The state of the art algorithms given as examples are competitive with the best existing algorithms for a selection of eigenspace
