E. Topholme, A. S. Wood, 1998-07-09 During this century as no other the two themes of mathematics and heat transfer have become inextricably intertwined and it was with this underlying sentiment that this volume was conceived It includes contributions from fifteen countries throughout the world covering various problems in heat transfer The contributors work in diverse fields and include mathematicians theoretical engineers experimentalists and industrialists

Ripples in Mathematics A. Jensen, Anders la Cour-Harbo, 2011-06-28 This introduction to the discrete wavelet transform and its applications is based on a novel approach to discrete wavelets called lifting After an elementary introduction connections of filter theory are presented and wavelet packet transforms are defined The time frequency plane is used for interpretation of signals problems with finite length signals are detailed and MATLAB is used for examples and implementation of transforms

Mathematics in Signal Processing III J. G. McWhirter, 1994 This is a survey of recent work in signal processing Some of the papers report progress which has been made in established areas of research such as adaptive filtering and spectral analysis Other papers relate to emerging topics of interest such as wavelet analysis fractal approximation and nonlinear filtering Particular effort was made to include papers which consider the development of mathematical techniques for various signal processing applications ranging from radar and communication systems to astronomy seismology and medical imagery The keynote paper entitled Adaptive Algorithms for Blind Channel Equalisation by Professor J G Proakis encompasses all of these characteristics and thus sets the tone for the rest of the volume whilst reporting some highly significant research

Digital Signal Processing with Matlab Examples, Volume 3 Jose Maria Giron-Sierra, 2016-11-21 This is the third volume in a trilogy on modern Signal Processing The three books provide a concise exposition of signal processing topics and a guide to support individual practical exploration based on MATLAB programs This book includes MATLAB codes to illustrate each of the main steps of the theory offering a self contained guide suitable for independent study The code is embedded in the text helping readers to put into practice the ideas and methods discussed The book primarily focuses on filter banks wavelets and images While the Fourier transform is adequate for periodic signals wavelets are more suitable for other cases such as short duration signals bursts spikes tweets lung sounds etc Both Fourier and wavelet transforms decompose signals into components Further both are also invertible so the original signals can be recovered from their components Compressed sensing has emerged as a promising idea One of the intended applications is networked devices or sensors which are now becoming a reality accordingly this topic is also addressed A selection of experiments that demonstrate image denoising applications are also included In the interest of reader friendliness the longer programs have been grouped in an appendix further a second appendix on optimization has been added to supplement the content of the last chapter
