Shokrollahi,2013-03-14 The algorithmic solution of problems has always been one of the major concerns of mathematics For a long time such solutions were based on an intuitive notion of algorithm It is only in this century that metamathematical problems have led to the intensive search for a precise and sufficiently general formalization of the notions of computability

and algorithm In the 1930s a number of quite different concepts for this purpose were proposed such as Turing machines WHILE programs recursive functions Markov algorithms and Thue systems All these concepts turned out to be equivalent a fact summarized in Church's thesis which says that the resulting definitions form an adequate formalization of the intuitive notion of computability This had and continues to have an enormous effect First of all with these notions it has been possible to prove that various problems are algorithmically unsolvable Among of group these undecidable problems are the halting problem the word problem theory the Post correspondence problem and Hilbert's tenth problem Secondly concepts like Turing machines and WHILE programs had a strong influence on the development of the first computers and programming languages In the era of digital computers the question of finding efficient solutions to algorithmically solvable problems has become increasingly important In addition the fact that some problems can be solved very efficiently while others seem to defy all attempts to find an efficient solution has called for a deeper understanding of the intrinsic computational difficulty of problems

Theory of the Non-linear Analog Phase Locked Loop Nikolaos I. Margaris, 2004-05-18 This book develops for the first time a complete and connected nonlinear theory for the analog Phase Locked Loop PLL which clarifies the obscure points of its complex non linear behaviour The book suggests new non linear models for the PLL components and applies the averaging method to analyse PLL The book presents the physical interpretation of the PLL operation locates the difficulties presented by its operation and suggests solutions to overcome these problems Finally it provides closed form expressions for all the important measures of the PLL and proposes new design criteria Nuclear Science Abstracts, 1974

Control Systems Theory and Applications for Linear Repetitive Processes Eric Rogers, Krzysztof Galkowski, David H. Owens, 2007-02-20 After motivating examples this monograph gives substantial new results on the analysis and control of linear repetitive processes These include further applications of the abstract model based stability theory which in particular shows the critical importance to the dynamics developed of the structure of the initial conditions at the start of each new pass the development of stability tests and performance bounds in terms of so called 1D and 2D Lyapunov equations It presents the development of a major bank of results on the structure and design of control laws including the case when there is uncertainty in the process model description together with numerically reliable computational algorithms Finally the application of some of these results in the area of iterative learning control is treated including experimental results from a chain conveyor system and a gantry robot system Systems Theory with Engineering Applications Mihail Voicu, 2021-09-09

This book presents in a rigorous and comprehensible way the mathematical description and analysis of linear dynamic systems and the controllability and observability of linear dynamic systems It also details the stability of linear dynamic systems automatic control systems and nonlinear dynamic systems and the optimal control of dynamic systems The treatment is both systemic and synthetic achieving rigorous and applicative solutions and is illustrated with engineering examples The book will appeal to scientists working in the practice of systems theory engineering automatic control computer science

Stochastic Models, Information Theory, and Lie Groups, Volume 2 Gregory S. Chirikjian, 2011-11-15 This unique two volume set presents the subjects of stochastic processes information theory and Lie groups in a unified setting thereby building bridges between fields that are rarely studied by the same people Unlike the many excellent formal treatments available for each of these subjects individually the emphasis in both of these volumes is on the use of stochastic geometric and group theoretic concepts in the modeling of physical phenomena Stochastic Models Information Theory and Lie Groups will be of interest to advanced undergraduate and graduate students researchers and practitioners working in applied mathematics the physical sciences and engineering Extensive exercises motivating examples and real world applications make the work suitable as a textbook for use in courses that emphasize applied stochastic processes or differential geometry
