Models Of Category Counts:

Models of Category Counts Bernard Fingleton, 1984-10-11 There has been a surge of interest in methods of analysing data that typically arise from surveys of various kinds of experiments in which the number of people animals places or objects occupying various categories are counted In this textbook first published in 1984 Dr Fingleton describes some techniques centred on the log linear model from the perspective of the social behavioural and environmental scientist **Regression**

Models for Categorical and Count Data Peter Martin, 2022-03-01 This text provides practical guidance on conducting regression analysis on categorical and count data Step by step and supported by lots of helpful graphs it covers both the theoretical underpinnings of these methods as well as their application giving you the skills needed to apply them to your own research It offers guidance on Using logistic regression models for binary ordinal and multinomial outcomes Applying count regression including Poisson negative binomial and zero inflated models Choosing the most appropriate model to use for your research The general principles of good statistical modelling in practice Part of The SAGE Quantitative Research Kit this book will give you the know how and confidence needed to succeed on your quantitative research journey

Regression Models for Categorical, Count, and Related Variables John P. Hoffmann, 2016-08-16 Social science and behavioral science students and researchers are often confronted with data that are categorical count a phenomenon or have been collected over time Sociologists examining the likelihood of interracial marriage political scientists studying voting behavior criminologists counting the number of offenses people commit health scientists studying the number of suicides across neighborhoods and psychologists modeling mental health treatment success are all interested in outcomes that are not continuous Instead they must measure and analyze these events and phenomena in a discrete manner This book provides an introduction and overview of several statistical models designed for these types of outcomes all presented with the assumption that the reader has only a good working knowledge of elementary algebra and has taken introductory statistics and linear regression analysis Numerous examples from the social sciences demonstrate the practical applications of these models The chapters address logistic and probit models including those designed for ordinal and nominal variables regular and zero inflated Poisson and negative binomial models event history models models for longitudinal data multilevel models and data reduction techniques such as principal components and factor analysis Each chapter discusses how to utilize the models and test their assumptions with the statistical software Stata and also includes exercise sets so readers can practice using these techniques Appendices show how to estimate the models in SAS SPSS and R provide a review of regression assumptions using simulations and discuss missing data A companion website includes downloadable versions of all the data sets used in the book Modelling Frequency and Count Data J. K. Lindsey, 1995-04-27 Categorical data analysis is a special area of generalised linear models which has become the most important area of statistical applications in many disciplines from medicine to social sciences This text presents the standard models and many newly developed ones in a language which

can be immediately applied in many modern statistical packages such as GLIM GENSTAT S Plus as well as SAS and LISP STAT The book is structure around the distinction between independent events occurring to different individuals resulting in frequencies and repeated events occurring to the same individuals yielding counts The book demonstates that much of modern statistics can be seen as special cases of categorical data models both generalized linear models and proportional hazards models can be fitted as log linear models More specialized topics such as Markov chains overdispersion and random effects are also covered Bayesian Multilevel Models for Repeated Measures Data Santiago Barreda,Noah

Silbert,2023-05-18 This comprehensive book is an introduction to multilevel Bayesian models in R using brms and the Stan programming language Featuring a series of fully worked analyses of repeated measures data the focus is placed on active learning through the analyses of the progressively more complicated models presented throughout the book In this book the authors offer an introduction to statistics entirely focused on repeated measures data beginning with very simple two group comparisons and ending with multinomial regression models with many random effects Across 13 well structured chapters readers are provided with all the code necessary to run all the analyses and make all the plots in the book as well as useful examples of how to interpret and write up their own analyses This book provides an accessible introduction for readers in any field with any level of statistical background Senior undergraduate students graduate students and experienced researchers looking to translate their skills with more traditional models to a Bayesian framework will benefit greatly from the lessons in this text **Applied Categorical and Count Data Analysis** Wan Tang,Hua He,Xin M. Tu,2023-04-06

Developed from the authors graduate level biostatistics course Applied Categorical and Count Data Analysis Second Edition explains how to perform the statistical analysis of discrete data including categorical and count outcomes The authors have been teaching categorical data analysis courses at the University of Rochester and Tulane University for more than a decade This book embodies their decade long experience and insight in teaching and applying statistical models for categorical and count data The authors describe the basic ideas underlying each concept model and approach to give readers a good grasp of the fundamentals of the methodology without relying on rigorous mathematical arguments The second edition is a major revision of the first adding much new material It covers classic concepts and popular topics such as contingency tables logistic regression models and Poisson regression models along with modern areas that include models for zero modified count outcomes parametric and semiparametric longitudinal data analysis reliability analysis and methods for dealing with missing values As in the first edition R SAS SPSS and Stata programming codes are provided for all the examples enabling readers to immediately experiment with the data in the examples and even adapt or extend the codes to fit data from their own studies Designed for a one semester course for graduate and senior undergraduate students in biostatistics this self contained text is also suitable as a self learning guide for biomedical and psychosocial researchers It will help readers analyze data with discrete variables in a wide range of biomedical and psychosocial research fields Features Describes the

basic ideas underlying each concept and model Includes R SAS SPSS and Stata programming codes for all the examples Features significantly expanded Chapters 4 5 and 8 Chapters 4 6 and 9 in the second edition Expands discussion for subtle issues in longitudinal and clustered data analysis such as time varying covariates and comparison of generalized linear mixed effect models with GEE

Models for Discrete Data Daniel Zelterman, 1999-01-21 Discrete or count data arise in experiments where the outcome variables are the numbers of individuals classified into unique non overlapping categories This revised edition describes the statistical models used in the analysis and summary of such data and provides a sound introduction to the subject for graduate students and practitioners needing a review of the methodology With many numerical examples throughout it includes topics not covered in depth elsewhere such as the negative multinomial distribution the many forms of the hypergeometric distribution and coordinate free models A detailed treatment of sample size estimation and power are given in terms of both exact inference and asymptotic non central chi squared methods A new section covering Poisson regression has also been included An important feature of this book missing elsewhere is the integration of the software into the text Many more exercises are provided including 84% more applied exercises than in the previous edition helping consolidate the reader's understanding of all subjects covered and making the book highly suitable for use in a classroom setting Several new datasets mostly from the health and medical sector are discussed including previously unpublished data from a study of Tourette's Syndrome in children

Reliability, Risk, and Safety, Three Volume Set Radim Bris, Carlos Guedes Soares, Sebastián Martorell, 2009-08-20 Containing papers presented at the 18th European Safety and Reliability Conference ESREL 2009 in Prague Czech Republic September 2009 Reliability Risk and Safety Theory and Applications will be of interest for academics and professionals working in a wide range of industrial and governmental sectors including civil and environmental engineering energy production and distribution information technology and telecommunications critical infrastructures and insurance and finance

Alternative Models of Addiction Hanna Pickard, Serge H. Ahmed, Bennett Foddy, 2015-12-07 For much of the 20th century theories of addictive behaviour and motivation were polarized between two models The first model viewed addiction as a moral failure for which addicts are rightly held responsible and judged accordingly The second model in contrast viewed addiction as a specific brain disease caused by neurobiological adaptations occurring in response to chronic drug or alcohol use and over which addicts have no choice or control As our capacity to observe neurobiological phenomena improved the second model became scientific orthodoxy increasingly dominating addiction research and informing public understandings of addiction More recently however a dissenting view has emerged within addiction research based partly on new scientific research and partly on progress in philosophical and psychological understandings of relevant mental phenomena This view does not revert to treating addiction as a moral failure but nonetheless holds that addictive behaviour is fundamentally motivated by choice and subject to at least a degree of voluntary control On this alternative model of addiction addictive behaviour is an instrumental

means to ends that are desired by the individual although much controversy exists with respect to the rationality or irrationality of these ends the degree and nature of the voluntary control of addictive behaviour and motivation the explanation of the difference between addictive and non addictive behaviour and motivation and lastly the extent to which addictive behaviour and motivation is correctly characterised as pathological or diseased This research topic includes papers in the traditions of neuroscience psychology philosophy law and social science that explore alternative understandings of addiction
