Salzano,1975 Non Aboriginal material *Natural Selection in Human Populations* D. F. Roberts,G. A. Harrison,1959 *Human Population Genetics* John H. Relethford,2012-03-27 Introductory guide to human population genetics and microevolutionary theory Providing an introduction to mathematical population genetics Human Population Genetics gives basic background on the mechanisms of human microevolution This text combines mathematics biology and anthropology and is best suited for advanced undergraduate and graduate study Thorough and accessible Human Population Genetics presents concepts and methods of population genetics specific to human population study utilizing uncomplicated mathematics like high school algebra and basic concepts of probability to explain theories central to the field By describing changes in the frequency of genetic variants from one generation to the next this book hones in on the mathematical basis of evolutionary theory Human Population Genetics includes Helpful formulae for learning ease Graphs and analogies that make basic points and relate the evolutionary process to mathematical ideas Glossary terms marked in boldface within the book the first time they appear In text citations that act as reference points for further research Exemplary case studies Topics such as Hardy Weinberg equilibrium inbreeding mutation genetic drift natural selection and gene flow Human Population Genetics solidifies knowledge learned in introductory biological anthropology or biology courses and makes it applicable to genetic study NOTE errata for the first edition can be found at the author s website http://employees.oneonta.edu/relethjh/HPG_errata.pdf **Natural Selection in Human Populations** Anthony Clifford Allison,University of Kansas,1962 **Admixture Dynamics, Natural Selection and Diseases in Admixed Populations** Wenfei Jin,2015-10-20 In this thesis Dr Jin presents the distribution of ancestral chromosomal segments in the admixed genome which could provide the information needed to explore population admixture dynamics The author derives accurate population histories of African Americans and Mexicans using genome wide single nucleotide polymorphisms SNPs data Mapping the genetic background facilitates the study of natural selection in the admixed population and the author identifies the signals of selection in African Americans since their African ancestors left for America He further demonstrates that many of the selection signals were associated with African American specific high risk diseases such as prostate cancer and hypertension suggesting an important role these disease related genes might have played in adapting to their new environment Lastly the author reveals the complexity of natural selection in shaping human susceptibility to disease The thesis significantly advances our understanding of the recent population admixture adaptation to local environment and its health implications **Natural Selection and Genetic Drift** Joshua Richardson,2016 Natural selection is the process which being the most important factor of evolution promotes rising

of adaptability and prevents destructive consequences of all other processes The concept of natural selection is a discordant problem of evolutionary human genetics Despite popularity of a hypothesis of neutral evolution the majority of scientists consider that selection has played main role in evolution of species and has generated all biological diversity of human populations This book presents research on natural selection and genetic drift The author of the first chapter provides an all embracing macroevolutionary perspective on the processes of the evolution of life and culture on earth The author investigates a complementary form of natural selection that diverges from the traditional form in that it is acting independently of the external environment The next chapter discusses natural selection and diabetes mellitus The last chapter examines how the genetic drift among native people from South American the Gran Chaco region affects interleukin 1 receptor antagonist variation

Darwinian Populations and Natural Selection Peter Godfrey-Smith, 2009-03-26 In 1859 Darwin described a deceptively simple mechanism that he called natural selection a combination of variation inheritance and reproductive success He argued that this mechanism was the key to explaining the most puzzling features of the natural world and science and philosophy were changed forever as a result The exact nature of the Darwinian process has been controversial ever since however Godfrey Smith draws on new developments in biology philosophy of science and other fields to give a new analysis and extension of Darwin's idea The central concept used is that of a Darwinian population a collection of things with the capacity to undergo change by natural selection From this starting point new analyses of the role of genes in evolution the application of Darwinian ideas to cultural change and evolutionary transitions that produce complex organisms and societies are developed Darwinian Populations and Natural Selection will be essential reading for anyone interested in evolutionary theory

Human Population Biology Michael A. Little, Jere D. Haas, 1989 This book is a careful integration of the social and biological sciences drawing on anthropology biology human ecology and medicine to provide a comprehensive understanding of how our species adapts to natural and man made environments Part I presents techniques to adapt and apply demographic methods to small populations particularly important for studying non Western populations Part II discusses the relationship of medical genetics to human adaptability and patterns of disease in non Western populations Part III covers capacity climatic stress and nutrition Part IV presents methods for growth assessment and prediction and addresses the topic of aging The final section Part V presents integrated case studies of human adaptation to high altitude and patterns of modernization and stress resulting from cultural change

The Statistics of Natural Selection on Animal Populations Brian F. Manly, 2013-03-09 In the concluding chapter of his famous book on the theory of evolution by natural selection Charles Darwin 1859 remarked that When the views entertained in this volume on the origin of species or when analogous views are generally admitted we can dimly foresee that there will be a considerable revolution in natural history This proved of course to be completely correct At present there is a great divergence of opinion about the general importance of natural selection in the evolutionary process Nevertheless biologists are on the whole united in their acceptance of the potential power of selection in changing populations Given this situation it is not surprising to find that many attempts to detect the effects of natural selection have been made since the time of Darwin This area of study has been called ecological genetics It involves the collection of data of various kinds and in many cases the development of special methods for analysing these data This book is a summary of methods for data analysis concentrating on those that are applicable to animal populations particularly wild populations
