Patterns, Function and Application of Seed Microbiome

Mohammad Yaseen Mir,Javid A. Parray,Saima Hamid,Munagala S. Reddy,2025-02-06 Patterns Function and Application of Seed Microbiome Bacteria Fungi and Viruses presents the current understanding of seed and microbiota associations emphasizing recent findings that highlight the latest insights into these interactions and how they may ultimately influence plant ecology health and productivity in both natural and agricultural systems The

development and dispersal of seeds and their transition to seedlings are among the most critical stages of the life cycle of plants and seed health is of crucial global importance for producing both quantity and high quality crops to feed world's population. It is important for seeds to be produced that contain the best hybrid embryo so that it is free of diseases, includes beneficial endophytes and ensures a healthy start of a seedling. Focusing on the role of seed microbiota, their transmission and implications for producing healthier seeds as well as the relationship between the seed microbiome and primed plant resistance, this book reveals the targeted use of the seed microbiome to enrich the soil biodiversity and its resilience and its resulting impact on plant health and yield. It also explores the importance of nanotechnology in the development and production of crops for both improved plant production and plant protection. It explores the different microbes that are vectored onto and within the seeds of both cultivated and non-cultivated plants with an emphasis on the importance and roles of seed microbiomes in sustainable agriculture. It explains how to change seeds to increase microbiome vectoring, repairing damaged ones and conserves seed microbiota. It also presents seed microbiome roles for plant health and design effective microbiome engineering. Explores seed microbiome transmission and implications for producing healthier seeds. Includes modelling and meta-analysis of seed microbiome. Presents insights into the assembly and structure framework of seed microbiomes. Includes metagenomics and the potential of seed endophytes. Considers the seed microbiome as bio-control agents. **Soilborne**

Microbial Plant Pathogens and Disease Management, Volume Two P. Narayanasamy, 2019-10-08 Crop disease management strategies revolve around the principles of exclusion, eradication and immunization. Cultural practices are aimed at preventing or reducing the accumulation of pathogen population inoculum. Development of cultivars with genetic resistance by transgressing resistance genes through traditional breeding procedures or biotechnological techniques is the most effective and acceptable strategy as it is environment friendly and does not need any additional cost to the grower. Assessment of different grades of resistance of cultivars or genotypes to soilborne microbial pathogens has been possible by quantifying pathogen populations or their DNA contents in the test plants by applying biological and molecular methods. This second volume of a two-volume set focuses on the soilborne microbial plant pathogens and the diseases caused by them. The book provides information on ecology and epidemiology of soilborne microbial plant pathogens and various strategies applicable for effective management of diseases. Chapters cover exclusion and prevention strategies, improvement of host plant resistance, biological management, application of chemicals and integration of these disease management strategies. Features: Discusses various aspects of soilborne microbial plant pathogens to develop effective methods of managing diseases. Presents information on epidemiology and ecology of soilborne microbial plant pathogens. Facilitates the application of management strategies alone or in combination with others for effective suppression of disease development. Features information on application of biotic and abiotic biological control agents (BCAs) to suppress pathogen development either by directly acting on the pathogens or indirectly by enhancing host resistance to the pathogens. Employs biotic and abiotic

biocontrol agents either to replace or reduce the use of chemicals is an achievable approach for managing the soilborne microbial pathogens
