Klaus R. Scherer, Angela Schorr, Tom Johnstone, 2001-05-03 The scientific study of emotion has long been dominated by theories emphasizing the subjective experience of emotions and their accompanying expressive and physiological responses. The processes by which different emotions are elicited has received less attention, the implicit assumption being that certain emotions arise automatically in response to certain types of events or situations. Such an assumption is incompatible with data showing that similar situations can provoke a range of emotions in different individuals or even the same individual at different times. Appraisal theory first suggested by Magda Arnold and Richard Lazarus was formulated to address this shortcoming in our understanding of emotion. The central tenet of appraisal theory is that emotions are elicited according to an individual's subjective interpretation or evaluation of important events or situations. Appraisal research focuses on identifying the evaluative dimensions or criteria that predict which emotion will be elicited in an individual as well as linking the appraisal process with the production of emotional responses. This book represents the first full scale summary of the current state of appraisal research. Separate sections cover the history of appraisal theory and its fundamental ideas, the views of some of the major theorists currently active in the field, theoretical and methodological problems with the appraisal approach including suggestions for their resolution, social cultural and individual differences and the application of appraisal theory to understanding and treating emotional pathology and the methodology used in appraisal research including measuring and analyzing self report, physiological, facial and vocal indicators of appraisal and simulating appraisal processes via computational models. Intended for advanced students and researchers in emotion psychology, it provides an authoritative assessment and critique of the current state of the art in appraisal research. *Psychology of Entertainment* Jennings

Bryant, Peter Vorderer, 2013-10-31 As entertainment becomes a trillion dollar a year industry worldwide as our modern era increasingly lives up to its label of the entertainment age and as economists begin to recognize that entertainment has become the driving force of the new world economy, it is safe to say that scholars are beginning to take entertainment seriously. The scholarly spin on entertainment has been manifested in traditional ways as well as innovative ones. Representing the current state of theory and research, *Psychology of Entertainment* promises to be the most comprehensive and up to date volume on entertainment. It serves to define the new area of study and provides a theoretical spin for future work in the area. Divided into three basic parts, this book addresses the fundamental mechanisms and processes involved in orienting to and selecting entertainment fare as well as receiving and processing it, explores the mechanisms and processes by which we are entertained by the media messages we select and receive and provides an opportunity for the application of well established as well as emerging psychological and psychobiological theories to be applied to the study of entertainment in ways that seldom have been utilized previously. *Psychology of Entertainment* will appeal to scholars, researchers and graduate students in media studies and mass communication, psychology, marketing and other areas contributing to the entertainment studies area. **The Psychology of Facial Expression** James A. Behavior Joseph Glicksohn, 2002-05-31 Criminological theory dating back one hundred years has been aware of the need to develop a neurobiology of extroversion impulsivity frontal lobe dysfunction and aggressive behavior yet in the twentieth century criminologists have largely forsaken this psychobiological legacy The Neurobiology of Criminal Behavior looks at this legacy with reference to a variety of neurobiological methodologies currently in vogue The authors are all distinguished researchers who have contributed considerably to their respective fields of psychiatry psychology psychobiology and neuroscience

Aggression and Violence David M. Stoff, Robert B. Cairns, 2014-02-04 Conceived at a time when biological research on aggression and violence was drawn into controversy because of sociopolitical questions about its study this volume provides an up to date account of recent biological studies performed mostly on humans A group of scientists recognized the importance of freedom of inquiry and deemed it vital to address the most promising biological research in the field The focus on biological mechanisms is not meant to imply that biological variables are paramount as a determinant of violence Rather biological variables operate in conjunction with other variables contributing to aggression or violence and a complete understanding of this phenomenon requires consideration of all influences bearing on it This book will familiarize readers with the rapidly growing and increasingly significant body of knowledge on the biological bases of human antisocial

aggressive and violent behaviors The editors concentrated on biological influences that support the basic physiological and biochemical processes of the brain and did not cover those biological influences that impact on the health of the individual such as head injury pregnancy and birth complications diet and exposure to lead and other toxins They focused on biological influences to illuminate their role in the complex behavioral phenomenon of violence Three different approaches to the biological study of human antisocial aggressive and violent behaviors are represented genetic neurobiological and biosocial Representing each of these three approaches individual chapters from investigators in psychobiology biological psychiatry and basic clinical neurosciences address the most recent experimental findings methods theory and common misconceptions in the biological study of aggression and violence The areas of primary focus are behavior and molecular genetics neurochemistry and hormones neuroimaging psychophysiology and developmental psychobiology Generally speaking investigators following these different approaches have experience in different scientific backgrounds select different methods generate different analyses employ different conceptual definitions for some of the same terms and assume a different philosophical stance in attempting to explain violence Nevertheless all are united in their efforts to understand the biological underpinnings of violence This book then assumes a comprehensive approach wherein different levels of analysis and different approaches inform each other It is clear from the studies reported that aggression and violence are multidetermined phenomena and understanding them requires an interdisciplinary approach spanning economic sociopolitical psychological sociological and criminological as well as biomedical considerations Nature biology and nurture experience context are fundamentally inseparable in explaining aggression and violence biology may affect experience or context but experience or context also influences biology Both need to be studied in a search for explanations of this phenomena
