Low Power/Low Noise Electronics Technologies for Wireless Communications, 2001 We had previously written a Final Report for this award on August 1 2001 At that time we provided ARO as Appendix to Final Report with three copies of the book RF Technologies for Low Power Wireless Communications Due to administrative reasons we requested and were granted an extended contractual period to January 31 2002 This period was used only to complete the last remaining technical activity that was carried out by the group of T Itoh in the area of Active Integrated Antennas based on GaN transistor

Ultra-Low Power Wireless Technologies for Sensor Networks Brian Otis, Jan Rabaey, 2007-02-24 transconductance efficiency of all critical devices in order to reduce the necessary bias current However reducing the current density also results in a severely decreased device f An optimization of the current density is required to provide the correct balance between transconductance efficiency and bandwidth Plots such as Figure 2.1 are useful tools for designers when choosing appropriate transistor bias points Technology scaling allows greatly increased f realization for a given IC Thus weak inversion biasing for RF T design will become increasingly useful in future technology nodes Throughout this work the IC of critical transistors will be discussed Most of the RF devices are biased in moderate to weak inversion to achieve enhanced transconductance efficiency and reduced bias current

2.2 MEMS Background The relatively new field of Radio Frequency Microelectro Mechanical Systems RF MEMS provides unique opportunities for RF transceiver designers This section provides background on RF MEMS and provides insight into the opportunities presented by these new technologies The field of RF MEMS includes the design and utilization of RF filters resonators switches and other passive mechanical structures constructed using bulk processed integrated circuit fabrication techniques

To date these devices have been commercially used as discrete board mounted components primarily used to enhance the miniaturization of mobile phones However RF MEMS components have the potential to be batch fabricated using existing integrated circuit fabrication techniques
