Modern Cell Biology Volume 3:

An Introduction to the History of Chronobiology, Volume 3 Jole Shackelford, 2022-12-27 In three volumes historian Jole Shackelford delineates the history of the study of biological rhythms now widely known as chronobiology from antiquity into the twentieth century Perhaps the most well known biological rhythm is the circadian rhythm tied to the cycles of day and night and often referred to as the body clock But there are many other biological rhythms and although scientists and the natural philosophers who preceded them have long known about them only in the past thirty years have a handful of pioneering scientists begun to study such rhythms in plants and animals seriously Tracing the intellectual and institutional development of biological rhythm studies Shackelford offers a meaningful evidence based account of a field that today holds great promise for applications in agriculture health care and public health Volume 1 follows early biological observations and research chiefly on plants volume 2 turns to animal and human rhythms and the disciplinary contexts for chronobiological investigation and volume 3 focuses primarily on twentieth century researchers who modeled biological clocks and sought them out including three molecular biologists whose work in determining clock mechanisms earned them a Nobel Prize in 2017

Embryology of Flowering Plants: Terminology and Concepts, Vol. 3 T B Batygina, 2019-04-23 Plant embryology dealing with the regularities of initiation and the first stages of development of an organism is now flourishing because of the overall progress being made in natural sciences Such discoveries of the 20th century as production of plants from a single somatic cell experimental haploidy and parasexual hybridization were of general biological significance The combined efforts of embryologists geneticists and molecular biologists yielded the discovery of specific genes that control meiosis egg cell development and early stages of embryogenesis The tendency to synthesize data of embryology and genetics has become increasingly noticeable It is connected with the fact that the majority of problems connected with morphogenesis such as differentiation specialization the evaluation of features and the definition of the notions gene and feature and genotype and phenotype concern embryology and genetics embryogenetics in one way or another Evolutionary embryology has given rise to a new approach to the study of problems of adaptation in plants In connection with the problem of preserving biological diversity under conditions of ecological stress special attention is paid to ecological embryology revealing the critical periods in early ontogenesis and plasticity and tolerance of reproductive systems at the level of species and population The study of variability of morphogenesis and phenotype in population life cycle variations and the diversity of reproductive systems is the most important point in the population embryology of plants

Human Forms Ian Duncan,2024-12-17 A major rethinking of the European novel and its relationship to early evolutionary science The 120 years between Henry Fielding s Tom Jones 1749 and George Eliot s Middlemarch 1871 marked both the rise of the novel and the shift from the presumption of a stable universal human nature to one that changes over time In Human

Forms Ian Duncan reorients our understanding of the novel's formation during its cultural ascendancy arguing that fiction produced new knowledge in a period characterized by the interplay between literary and scientific discourses even as the two were separating into distinct domains Duncan focuses on several crisis points the contentious formation of a natural history of the human species in the late Enlightenment the emergence of new genres such as the Romantic bildungsroman historical novels by Walter Scott and Victor Hugo that confronted the dissolution of the idea of a fixed human nature Charles Dickens's transformist aesthetic and its challenge to Victorian realism and George Eliot's reckoning with the nineteenth century revolutions in the human and natural sciences Modeling the modern scientific conception of a developmental human nature the novel became a major experimental instrument for managing the new set of divisions between nature and history individual and species human and biological life that replaced the ancient schism between animal body and immortal soul The first book to explore the interaction of European fiction with the natural history of man from the late Enlightenment through the mid Victorian era *Human Forms* sets a new standard for work on natural history and the novel
