Linear Matrix Inequalities in System and Control Theory Stephen Boyd, Laurent El Ghaoui, Eric Feron, Venkataramanan Balakrishnan, 1994-01-01 In this book the authors reduce a wide variety of problems arising in system and control theory to a handful of convex and quasiconvex optimization problems that involve linear matrix inequalities These optimization problems can be solved using recently developed numerical algorithms that not only are polynomial time but also work very well in practice the reduction therefore can be considered a solution to the original problems This book opens up an important new research area in which convex optimization is combined with system and control theory resulting in the solution of a large number of previously unsolved problems

Control and Estimation in Distributed Parameter Systems H. T. Banks, 1992-01-01 Research in control and estimation of distributed parameter systems encompasses a wide range of applications including both fundamental science and emerging technologies The latter include smart materials piezoceramics shape memory alloys magnetostrictives electrorheological fluids fabrication and testing design of high pressure chemical vapor deposition CVD reactors for production of microelectronic surfaces e g semiconductors while the former include groundwater contamination cleanup and other environmental modeling questions climatology flow control and fluid structure interactions as well as more traditional topics in biology mechanics and acoustics These expository papers provide substantial stimulus to both young researchers and experienced investigators in control theory Includes a comprehensive and lucid presentation that relates frequency domain techniques to state space or time domain approaches for infinite dimensional systems including design of robust stabilizing and finite dimensional controllers for infinite dimensional systems It focuses on these two approaches to control design in an integrated system theoretic framework This is excellent reading for researchers in both the frequency domain and time domain control communities In other articles topics considered include pointwise control of distributed parameter systems bounded and unbounded sensors and actuators stabilization issues for large flexible structures and an overview discussion of damping models for flexible structures

Algebraic Methods for Nonlinear Control Systems Giuseppe Conte, Claude H. Moog, Anna Maria Perdon, 2007-01-19 A self contained introduction to algebraic control for nonlinear systems suitable for researchers and graduate students Algebraic Methods for Nonlinear Control Systems develops a linear algebraic alternative to the usual differential geometric approach to nonlinear control using vector spaces over suitable fields of nonlinear functions It describes a range of results some of which can be derived using differential geometry but many of which cannot They include classical and generalized realization in the nonlinear context accessibility and observability recast

for the linear algebraic setting discussion and solution of basic feedback problems results for dynamic and static state and output feedback Dynamic feedback and realization are shown to be dealt with and solved much more easily in the algebraic framework The second edition has been completely revised with new text examples and exercises it is divided into two parts necessary methodology and applications to control problems

Nonlinear Control Systems Alberto Isidori, 2013-04-17 The purpose of this book is to present a self contained description of the fundamentals of the theory of nonlinear control systems with special emphasis on the differential geometric approach The book is intended as a graduate text as well as a reference to scientists and engineers involved in the analysis and design of feedback systems The first version of this book was written in 1983 while I was teaching at the Department of Systems Science and Mathematics at Washington University in St Louis This new edition integrates my subsequent teaching experience gained at the University of Illinois in Urbana Champaign in 1987 at the Carl Cranz Gesellschaft in Oberpfaffenhofen in 1987 at the University of California in Berkeley in 1988 In addition to a major rearrangement of the last two Chapters of the first version this new edition incorporates two additional Chapters at a more elementary level and an exposition of some relevant research findings which have occurred since 1985 In the past few years differential geometry has proved to be an effective means of analysis and design of nonlinear control systems as it was in the past for the Laplace transform complex variable theory and linear algebra in relation to linear systems Synthesis problems of longstanding interest like disturbance decoupling noninteracting control output regulation and the shaping of the input output response can be dealt with relative ease on the basis of mathematical concepts that can be easily acquired by a control scientist
