

am, carbon, and oxygen. Dolomite is only a little in use. Its streak is like that of gypsum and calcite. Some varieties of granite the dark are hornblende instead of black. Hornblende is the commonest of silicates in the mineral family called

Fairly large crystals of quartz are often found. This mineral is dark green or black. The name comes from a Greek "decoct." Hornblende is the mineral galena, a lead which is a metal. Hornblende of lead.

The other two amphiboles made of thin fibers are used as asbestos. Amphibole is a form into ornaments.

Micas and feldspar contain silicon and oxygen. The other pyroxenes.

Some pyroxene, often found as

word for "luster." Amphibole is always dark, often black. So is olivine. Diopside, on the other hand, is sometimes white. Varieties of another pyroxene, spodumene, are beautiful gemstones. Some jade is jadeite, still another prized pyroxene.

The story of minerals containing silicon continues with the zeolites. None of the zeolites is itself very important, and nowhere are there great amounts of them. But the 50 or so minerals in the big family are scattered far and wide. Zeolite minerals are usually found as crystals. Those shown are all pearly white, but stilbite crystals are often a salmon color or red, and chabazite is sometimes pink or yellow. Natrolite is often called needle zeolite because of its slender crystals spread out like a fan.

When a zeolite is heated, water bubbles up from it. "Zeolite" comes from Greek words that mean "boiling stone."

Five of the other six minerals pictured here tell more of the silicon story. The only one that is not partly silicon is lithium. It is a soft metal, and is found as

pages in another way, too. It is the only one that leaves a colored streak. The streak is the same color as the mineral—yellowish brown. Limonite gets its color from the iron in it. Much soil gets its color from limonite.

Olivine, as you could guess, gets its name from its color. It usually is olive green. Clear varieties of this hard mineral (6½-7) are used as gems.

Chlorite, too, was named for its color. The name chlorite means "green." Many greenish rocks owe their color to chlorite, which is soft enough to be scratched with a fingernail. Like mica, chlorite crystals can be split into thin sheets.

The tourmaline pictured looks a little like hornblende. But not all tourmaline is dark. Some is white, some green, some pink, and some red. A single crystal of watermelon tourmaline may have a red core surrounded by a white zone, which in turn is surrounded by green. As you would expect, tourmaline crystals are often cut as gems.

Kaolin is a name for a small group of minerals impossible to tell apart in an ordinary way. All contain silicon, oxygen, and aluminum, and all are white when pure. Impure kaolin is common around the world. Most people know it as clay. The mineral makes up a greater part of soil. It is not so soft that it has an earthy smell.

Serpentine is a very common mineral with a greasy feel. Some varieties carved and polished easily. Foliated serpentine looks much like polished soapstone. But not all serpentine can be polished. A variety called chrysotile
