Abstract

Kernel methods provide an elegant framework for developing nonlinear learning algorithms from simple linear methods. Though these methods have superior empirical performance in several real data applications, their usefulness is inhibited by the significant computational burden incurred in large sample situations. Various approximation schemes have been proposed in the literature to alleviate these computational issues, and the approximate kernel machines are shown to retain the empirical performance. However, the theoretical properties of these approximate kernel machines are less well understood. In this work, we theoretically study the trade-off between computational complexity and statistical accuracy in Nyström approximate kernel principal component analysis (KPCA), wherein we show that the Nyström approximate KPCA matches the statistical performance of (non-approximate) KPCA while remaining computationally beneficial. Additionally, we show that Nyström approximate KPCA outperforms the statistical behavior of another popular approximation scheme, the random feature approximation, when applied to KPCA.

1 Introduction

Principal component analysis (PCA) (Jolliffe, 1986) is an unsupervised learning technique in which a random variable X taking values in $\mathbb{R}^d$ is projected onto the direction $\mathbf{a} \in \mathbb{R}^d$ such that $\text{Var}[\mathbf{a}^\top X]$ is maximized. Further, for some $\ell < d$, PCA may be used to find an ℓ -dimensional subspace retaining the maximum possible variance of X , making PCA a popular methodology for dimension reduction and feature extraction. This low-dimensional subspace is the ℓ -eigenspace, i.e., the span of the eigenvectors associated with the top ℓ eigenvalues of the covariance matrix $\mathbb{E}XX^\top - \mathbb{E}X\mathbb{E}X^\top$. The respective eigenvectors are referred to as the principal components of the data, and a lower-dimensional representation of the input data may be computed by projecting onto the principal components.

The principal components outputted by PCA are linearly related to the original coordinates; however, in many cases a non-linear component provides a better description of the data. Kernel PCA (KPCA) (Schölkopf et al., 1998) is a non-linear extension of PCA which maps the original

With demand and expenditure rising it's more crucial than ever to know how well the healthcare system and all its components from staff member to regional network are performing. This requires data which inevitably differ in form and quality. It also requires statistical methods the output of which needs to be presented so that it can be understood by whoever needs it to make decisions. Statistical Methods for Healthcare Performance Monitoring covers measuring quality types of data risk adjustment defining good and bad performance statistical monitoring presenting the results to different audiences and evaluating the monitoring system itself. Using examples from around the world it brings all the issues and perspectives together in a largely non technical way for clinicians managers and methodologists. Statistical Methods for Healthcare Performance Monitoring is aimed at statisticians and researchers who need to know how to measure and compare performance health service regulators health service managers with responsibilities for monitoring performance and quality improvement scientists including those involved in clinical audits.

Frontiers in Statistical Quality Control 13 Sven Knoth, Wolfgang Schmid, 2021-05-15 This contributed book focuses on major aspects of statistical quality control shares insights into important new developments in the field and adapts established statistical quality control methods for use in e.g. big data network analysis and medical applications. The content is divided into two parts the first of which mainly addresses statistical process control also known as statistical process monitoring. In turn the second part explores selected topics in statistical quality control including measurement uncertainty analysis and data quality. The peer reviewed contributions gathered here were originally presented at the 13th International Workshop on Intelligent Statistical Quality Control ISQC 2019 held in Hong Kong on August 12-14 2019. Taken together they bridge the gap between theory and practice making the book of interest to both practitioners and researchers in the field of statistical quality control.

Statistical Monitoring of Clinical Trials Michael A. Proschan, K. K. Gordon Lan, Janet Turk Witten, 2006-12-31 The approach taken in this book is to studies monitored over time what the Central Limit Theorem is to studies with only one analysis. Just as the Central Limit Theorem shows that test statistics involving very different types of clinical trial outcomes are asymptotically normal this book shows that the joint distribution of the test statistics at different analysis times is asymptotically multivariate normal with the correlation structure of Brownian motion the B value irrespective of the test statistic. Thus this book offers statisticians an accessible incremental approach to understanding Brownian motion as related to clinical trials.

The book is designed not only for biopharmaceutical professionals such as statisticians, safety specialists, pharmacovigilance experts and pharmacoepidemiologists who can use the book as self-learning materials or in short courses or training programs but also for graduate students in statistics and biomedical data science for a one semester course. Each chapter provides supplements and problems as more readings and exercises.

Introduction to Statistical Methods for Biosurveillance Ronald D. Fricker, 2013-02-25. Bioterrorism is not a new threat but in an increasingly interconnected world the potential for catastrophic outcomes is greater today than ever. The medical and public health communities are establishing biosurveillance systems designed to proactively monitor populations for possible disease outbreaks as a first line of defense. The ideal biosurveillance system should identify trends not visible to individual physicians and clinicians in near real time. Many of these systems use statistical algorithms to look for anomalies and to trigger epidemiologic investigation, quantification, localization and outbreak management. This book discusses the design and evaluation of statistical methods for effective biosurveillance for readers with minimal statistical training. Weaving public health and statistics together, it presents basic and more advanced methods with a focus on empirically demonstrating added value. Although the emphasis is on epidemiologic and syndromic surveillance, the statistical methods can be applied to a broad class of public health surveillance problems.

Introduction to Statistical Methods for Biosurveillance Ronald D. Fricker, 2013. While the public health philosophy of the 20th Century emphasizing prevention is ideal for addressing natural disease outbreaks, it is not sufficient to confront 21st Century threats where adversaries may use biological weapons agents as part of a long term campaign of aggression and terror. Health care providers and public health officers are among our first lines of defense. Therefore we are building on the progress of the past three years to further improve the preparedness of our public health and medical systems to address current and future BW biological warfare threats and to respond with greater speed and flexibility to multiple or repetitive attacks. Homeland Security Presidential Directive 21. Bioterrorism is not a new threat in the 21st century; thousands of years ago the plague and other contagious diseases were used in warfare but today the potential for catastrophic outcomes is greater than it has ever been. To address this threat the medical and public health communities are putting various measures in place including systems designed to proactively monitor populations for possible disease outbreaks.
