**Mechanisms of Viral Pathogenesis** A. Kohn, P. Fuchs, 2012-12-06 Venezuelan equine encephalitis VEE virus was first isolated in 1938 by Kuberski and Rios 1 from the brain of a horse which died during an epizootic of a previously unrecognized disease in Venezuela VEE related viruses were subsequently isolated during the period of 1943-1963 in Venezuela Colombia Peru Trinidad Brazil Surinam Argentina Panama Mexico and the United States 2 Shope et al 3 first defined the viruses in the VEE complex 1 explicitly showing serological relationships between classical VEE lucambo and Pixuna viruses Young and Johnson 2 serologically characterized a variety of VEE isolates and proposed that the complex be divided into four subtypes I II III and IV Viruses in subtype I were divided into five variants designated IA through IE During 1969-1971 a VEE epizootic epidemic occurred in South America Central America and the United States involving a subtype IAB virus which caused high mortality among equines and humans 4 Venezuelan equine encephalitis viruses are alpha togaviruses which contain a positive strand ribonucleic acid genome enclosed in an icosahedral nucleocapsid The virion has an envelope which contains two glycoproteins E2 of 55 000 daltons gp56 and E1 of 80 000 daltons gp50 5 6 Viral neutralization N and hemagglutination HA sites have been placed on E2 by the use of monospecific rabbit antiserum and monoclonal antibodies specific for purified viral structural proteins 7 10 Only anti E2 antiserum neutralized virus infectivity or blocked virus hemagglutination

Cancer Pathogenesis: Molecular and Cellular Mechanisms of Tumor evolution, Therapy-Resistance and Immune Evasion Sambhavi Animesh, Ajinkya Revankar, Lucio Miele, 2025-01-24 Cancer pathogenesis is a pathophysiological understanding of how molecular and cellular events play a causal role in transforming tumors from

benign to malignant state This often involves genetic epigenetic proteomic and metabolic alterations within solid tumors and blood cells Besides cell intrinsic factors tumors are also composed of stromal fibroblasts blood vessel and immune cells that are also implicated in tumor progression Immune evasion is another critical step of the cancer progression wherein tumor cells modulate host immune system to escape from getting destroyed Additionally stemness in cancer cells is another acquired intrinsic ability of self renewal differentiation heterogeneity and survival Such properties give an edge to the tumors to maintain malignancy and confers treatment resistance Most anti cancer therapies that trigger cell death senescence and or dormancy and may backfire into maladaptive responses that lead to therapy resistance and promote tumor progression Together these highlight the most challenging issues of cancer pathogenesis This Research Topic aims to summarize the cutting edge research for the broader understanding of the molecular and cellular determinants involved in cancer initiation and progression and their impact on the anti tumor therapies and immune evasion In summary this topic will help

researchers to gain a more comprehensive understanding of the cancer pathogenesis which can be used further in the development of novel therapies

#### **Molecular Mechanisms of Pathogenesis in Chagas' Disease**

John M. Kelly, 2003-08-31 Chagas disease which results from infection with the single cell parasite *Trypanosoma cruzi* is a debilitating condition that is a major problem in many parts of Latin America Rapid technical progress is now facilitating dissection of the molecular mechanisms of disease pathogenesis a process that will ultimately provide new strategies to alleviate the enormous public health burden associated with the infection In this book international experts review the buoyant status of Chagas disease research as we enter the post genome era and speculate on how the new findings will impact on drug and vaccine development The chapters outline how progress is being made on several fronts ranging from parasite population genetics to human immunology Researchers physicians and students with an interest in any aspect of molecular parasitology should find this book to be a valuable reference

Opportunistic pathogens: pathogenesis and multi-drug resistance mechanisms Shicheng Chen, Lisheng Liao, Mingxi Wang, 2025-04-17 The World Health Organization WHO has identified antimicrobial resistance AMR as one of the most critical global public health threats At least 4.95 million people death was caused by AMR in 2019 Even worse its potential economic impact is estimated to reach a staggering 100 trillion due to AMR in the next thirty years <https://www.who.int/health-topics/antimicrobial-resistance> Researching the development of antibiotic resistance and exploring ways to prevent detect and treat antimicrobial resistant infections have been prioritized in the medical microbiology field AMR mechanisms have been uncovered on many Enterobacteriaceae and Gram positive bacteria such as *Enterococcus faecium* and *Staphylococcus aureus* due to their clinical significance and diverse resistance mechanisms Unfortunately the opportunistic pathogens have been overlooked in the clinics because they are often identified as normal flora or common environmental organisms in human specimens Opportunistic pathogens may have low

pathogenicity while they can often cause serious infections in immunocompromised patients and lead to outbreak in the healthcare settings They may even lead to diseases in healthy individuals if being introduced into hosts system by traumatization Management of such infections is often challenging due to the lack of guidelines standards for antibiotic susceptibility tests as well as multi drug resistance MDR Lately diseases linked to non pathogenic microorganisms are becoming more common under typical conditions such as *Stenotrophomonas maltophilia* *Elizabethkingia* spp *Acinetobacter baumannii* and many others
