Abstract

In the present work we formally extend the theory of port-Hamiltonian systems to include random perturbations. In particular, suitably choosing the space of flow and effort variables we will show how several elements coming from possibly different physical domains can be interconnected in order to describe a dynamic system perturbed by general continuous semimartingale. Relevant enough, the noise does not enter into the system solely as an external random perturbation, since each port is itself intrinsically stochastic. Coherently to the classical deterministic setting, we will show how such an approach extends existing literature of stochastic Hamiltonian systems on pseudo-Poisson and pre-symplectic manifolds. Moreover, we will prove that a power-preserving interconnection of stochastic port-Hamiltonian systems is a stochastic port-Hamiltonian system as well.

Random Perturbations Of Hamiltonian Systems:

Random Perturbations of Hamiltonian Systems Mark Iosifovich Freidlin, Alexander D. Wentzell, 1994 Random perturbations of Hamiltonian systems in Euclidean spaces lead to stochastic processes on graphs and these graphs are defined by the Hamiltonian In the case of white noise type perturbations the limiting process will be a diffusion process on the graph Its characteristics are expressed through the Hamiltonian and the characteristics of the noise Freidlin and Wentzell calculate the process on the graph under certain conditions and develop a technique which allows consideration of a number of asymptotic problems The Dirichlet problem for corresponding elliptic equations with a small parameter are connected with boundary problems on the graph

Random Perturbations of Dynamical Systems Mark I. Freidlin, Alexander D. Wentzell, 2012-05-31 Many notions and results presented in the previous editions of this volume have since become quite popular in applications and many of them have been rediscovered in applied papers In the present 3rd edition small changes were made to the chapters in which long time behavior of the perturbed system is determined by large deviations Most of these changes concern terminology In particular it is explained that the notion of sub limiting distribution for a given initial point and a time scale is identical to the idea of metastability that the stochastic resonance is a manifestation of metastability and that the theory of this effect is a part of the large deviation theory The reader will also find new comments on the notion of quasi potential that the authors introduced more than forty years ago and new references to recent papers in which the proofs of some conjectures included in previous editions have been obtained Apart from the above mentioned changes the main innovations in the 3rd edition concern the averaging principle A new Section on deterministic perturbations of one degree of freedom systems was added in Chapter 8 It is shown there that pure deterministic perturbations of an oscillator may lead to a stochastic in a certain sense long time behavior of the system if the corresponding Hamiltonian has saddle points The usefulness of a joint consideration of classical theory of deterministic perturbations together with stochastic perturbations is illustrated in this section Also a new Chapter 9 has been inserted in which deterministic and stochastic perturbations of systems with many degrees of freedom are considered Because of the resonances stochastic regularization in this case is even more important

rapidly expanding area *Discretization of Homoclinic Orbits, Rapid Forcing and "Invisible" Chaos* Bernold Fiedler, Jürgen Scheurle, 1996 Numerically speaking continuous time dynamical systems do not exist Rather a discretized version is studied and interpreted in analogy to the continuous time dynamical system Over fixed finite time intervals this analogy is quite close and well understood in terms of discretization errors and sophisticated discretization schemes Over large or infinite time intervals this analogy is not so clear because discretization errors tend to accumulate exponentially with time In this paper we specifically investigate the correspondence between continuous and discrete time dynamical systems for homoclinic orbits By definition these are orbits which tend to the same stationary point for both large positive and large negative times

Martingale Problem for Interactive Measure-Valued Branching Diffusions Edwin Arend Perkins, 1995 This book develops stochastic integration with respect to Brownian trees and its associated stochastic calculus with the aim of proving pathwise existence and uniqueness in a stochastic equation driven by a historical Brownian motion Perkins uses these results and a Girsanov type theorem to prove that the martingale problem for the historical process associated with a wide class of interactive branching measure valued diffusions superprocesses is well posed The resulting measure valued processes will arise as limits of the empirical measures of branching particle systems in which particles interact through their spatial motions or to a lesser extent through their branching rates Symmetric Automorphisms of Free Products Darryl

Stochastic Climate Models Peter Imkeller, Jin-Song von Storch, 2012-12-06 The proceedings of the summer 1999 Chorin workshop on stochastic climate models captures well the spirit of enthusiasm of the workshop participants engaged in research in this exciting field It is amazing that nearly 25 years after the formal theory of natural climate variability generated by quasi white noise weather forcing was developed and almost 35 years after J M Mitchell first suggested this

mechanism as the origin of sea surface temperature fluctuations and climate variability there have arisen so many fresh perspectives and new applications of the theory The workshop has succeeded admirably in highlighting these new aspects while clarifying the position of stochastic climate modelling within the general framework of climate research and mathematical modelling The organizers can be congratulated in bringing together leading researchers covering a wide range of scientific expertise from mathematicians concerned with the derivation of stochastic models from first principles to applied climate modellers trying to understand the dynamics of the complex climate system Following the first burst of stochastic modelling papers in the decade from the mid seventies to the mid eighties in which the viability of the concept was demonstrated using relatively simple conceptual models there was a lull of work in this field One awaited the development of more sophisticated climate models with which one could carry out realistic quantitative analyses of the implications of stochastic forcing for the global climate system Now that these models have become widely available it is natural that one is witnessing a resurgence of stochastic modelling investigations

International Conference on Theory and Application in Nonlinear Dynamics (ICAND 2012) Visarath In, Antonio Palacios, Patrick Longhini, 2013-12-13 A collection of different lectures presented by experts in the field of nonlinear science provides the reader with contemporary cutting edge research works that bridge the gap between theory and device realizations of nonlinear phenomena Representative examples of topics covered include chaos gates social networks communication sensors lasers molecular motors biomedical anomalies stochastic resonance nano oscillators for generating microwave signals and related complex systems A common theme among these and many other related lectures is to model study understand and exploit the rich behavior exhibited by nonlinear systems to design and fabricate novel technologies with superior characteristics Consider for instance the fact that a shark's sensitivity to electric fields is 400 times more powerful than the most sophisticated electric field sensor In spite of significant advances in material properties in many cases it remains a daunting task to duplicate the superior signal processing capabilities of most animals Since nonlinear systems tend to be highly sensitive to perturbations when they occur near the onset of a bifurcation there are also lectures on the general topic of bifurcation theory and on how to exploit such bifurcations for signal enhancements purposes This manuscript will appeal to researchers interested in both theory and implementations of nonlinear systems

Second-Order Sturm-Liouville Difference Equations and Orthogonal Polynomials Alouf Jirari, 1995 This memoir presents machinery for analyzing many discrete physical situations and should be of interest to physicists engineers and mathematicians We develop a theory for regular and singular Sturm Liouville boundary value problems for difference equations generalizing many of the known results for differential equations We discuss the self adjointness of these problems as well as their abstract spectral resolution in the appropriate Hilbert space setting and give necessary and sufficient conditions for a second order difference operator to be self adjoint and have orthogonal polynomials as eigenfunctions

Tilting in Abelian Categories and Quasitilted Algebras Dieter Happel, Idun

Reiten, Sverre O. Smalø, 1996 We generalize tilting with respect to a tilting module of projective dimension at most one for an Artin algebra to tilting with respect to a torsion pair in an Abelian category Our construction is motivated by the connection between tilting and derived categories We develop a general theory for such tilting and are led to a generalization of tilting algebras which we call quasitilted algebras This class also contains the canonical algebras and we show that the quasitilted algebras are characterized by having global dimension at most two and each indecomposable module having projective dimension at most one or injective dimension at most one We also give other characterizations of quasitilted algebras and give methods for constructing such algebras
