Pattern Classification Neurofuzzy Methods And Their Comparison:

Pattern Classification Shigeo Abe, 2012-12-06 Neural networks have a learning capability but analysis of a trained network is difficult. On the other hand, extraction of fuzzy rules is difficult but once they have been extracted it is relatively easy to analyze the fuzzy system. This book solves the above problems by developing new learning paradigms and architectures for neural networks and fuzzy systems. The book consists of two parts: Pattern Classification and Function Approximation. In the first part, based on the synthesis principle of the neural network classifier, a new learning paradigm is discussed and classification performance and training time of the new paradigm for several real world data sets are compared with those of the widely used back propagation algorithm. Fuzzy classifiers of different architectures based on fuzzy rules can be defined with hyperbox, polyhedral or ellipsoidal regions. The book discusses the unified approach for training these fuzzy classifiers. The performance of the newly developed fuzzy classifiers and the conventional classifiers such as nearest neighbor classifiers and support vector machines are evaluated using several real world data sets and their advantages and disadvantages are clarified. In the second part, Function approximation is discussed, extending the discussions in the first part. Performance of the function approximators is compared. This book is aimed primarily at researchers and practitioners in the field of artificial intelligence and neural networks.

Support Vector Machines for Pattern Classification Shigeo Abe, 2010-07-23 A guide on the use of SVMs in pattern classification including a rigorous performance comparison of classifiers and regressors. The book presents architectures for multiclass classification and function approximation problems as well as evaluation criteria for classifiers and regressors. Features: Clarifies the characteristics of two class SVMs. Discusses kernel methods for improving the generalization ability of neural networks and fuzzy systems. Contains ample illustrations and examples. Includes performance evaluation using publicly available data sets. Examines Mahalanobis kernels, empirical feature space and the effect of model selection by cross validation. Covers sparse SVMs learning using privileged information, semi supervised learning, multiple classifier systems and multiple kernel learning. Explores incremental training, batch training and active set training methods and decomposition techniques for linear programming SVMs. Discusses variable selection for support vector regressors.
