

Conditional Random Fields

► Random Field

- Let $G = (Y, E)$ be a graph where each vertex Y_v is a random variable. Suppose $P(Y_v | \text{all other } Y) = P(Y_v | \text{neighbors}(Y_v))$ then Y is a random field.

► Example :

- $P(Y_5 | \text{all other } Y) = P(Y_5 | Y_4, Y_6)$

Random Fields On A Network:

Random Fields on a Network Xavier Guyon, 1995-06-23 The theory of spatial models over lattices or random fields as they are known has developed significantly over recent years This book provides a graduate level introduction to the subject which assumes only a basic knowledge of probability and statistics finite Markov chains and the spectral theory of second order processes A particular strength of this book is its emphasis on examples both to motivate the theory which is being developed and to demonstrate the applications which range from statistical mechanics to image analysis and from statistics to stochastic algorithms

Random Fields on a Network Xavier Guyon, 1995 **Estimation of Random Fields from Network Observations. Technical Report**, 1979 When one has observed a random field Z at some points and recorded its values network observations a natural problem is to estimate Z at points where there are no observations This dissertation deals first with this problem in an abstract setting in m dimensions later it considers the estimation of a spatial two dimensional random field The problem then is one of constructing an estimated map of Z over a geographic area For a given network of stations the quality of a map depends on the method of estimation But for the given method of estimation the quality of a map depends on the choice of locations for the stations This is the problem of network design Both the study of methods of estimation and the problem of network design are addressed 16 figures RWR **Data Science** Zhiwen

Probabilistic Graphical Models Daphne Koller,Nir Friedman,2009-07-31 A general framework for constructing and using probabilistic models of complex systems that would enable a computer to use available information for making decisions Most tasks require a person or an automated system to reason to reach conclusions based on available information The framework of probabilistic graphical models presented in this book provides a general approach for this task The approach is model based allowing interpretable models to be constructed and then manipulated by reasoning algorithms These models can also be learned automatically from data allowing the approach to be used in cases where manually constructing a model is difficult or even impossible Because uncertainty is an inescapable aspect of most real world applications the book focuses on probabilistic models which make the uncertainty explicit and provide models that are more faithful to reality Probabilistic Graphical Models discusses a variety of models spanning Bayesian networks undirected Markov networks discrete and continuous models and extensions to deal with dynamical systems and relational data For each class of models the text describes the three fundamental cornerstones representation inference and learning presenting both basic concepts and advanced techniques Finally the book considers the use of the proposed framework for causal reasoning and decision making under uncertainty The main text in each chapter provides the detailed technical development of the key ideas Most chapters also include boxes with additional material skill boxes which describe techniques case study boxes which discuss empirical cases related to the approach described in the text including applications in computer vision robotics natural language understanding and computational biology and concept boxes which present significant concepts drawn from the material in the chapter Instructors and readers can group chapters in various combinations from core topics to more technically advanced material to suit their particular needs
