Flood Forecasting Using Artificial Neural Networks P Varoonchotikul, 2003-01-01 Flood disasters continue to occur in many countries in the world and cause tremendous casualties and property damage To mitigate the effects of floods a range of structural and non structural measures have been employed including dykes channelling flood proofing property land use regulation and flood warning schemes Such schemes can include the use of Artificial Neural Networks ANN for modelling the rainfall run off process as it is a quick and flexible approach which gives very promising results However the inability of ANN to extrapolate beyond the limits of the training range is a serious limitation of the method and this book examines ways of side stepping or solving this complex issue Hydrological Models for Environmental Management

Mikhail V. Bolgov, Lars Gottschalk, Irina Krasovskaia, Robert J. Moore, 2012-12-06 This book contains a selection of papers from a NATO Advanced Research Workshop entitled Stochastic models of hydrological

processes and their applications to problems of environmental preservation convened in Moscow over the period 23-27 November 1998. The Workshop was unique in providing the first opportunity for over a decade for countries of the Russian Federation to interact with other countries across the world to discuss hydrological science issues relevant to environmental management. The contrasting schools of thought within the Russian Federation and with other countries proved a fascinating and valuable experience for those fortunate enough to attend. The scientific content of the Workshop was motivated by a number of concerns. Water is a key natural resource whose modelling and management is made complex by its inherent spatial unevenness and time variability. Traditional methods for investigating hydrological processes in nature employ stochastic modelling and forecasting. However, these are not well developed with regard to i) representing the characteristics of hydrological regimes and ii) investigating the influence of water factors on processes which arise in biological systems and those involving hydrochemical, geophysical and other processes.

Flowpath 2019 - National meeting on hydrogeology

Conference Flowpath, 2019-06-07 FLOWPATH 2019, the 4th National Meeting on Hydrogeology, was held in Milan from 12th to 14th June 2019. According to the aim of the previous Editions of FLOWPATH held in Bologna 2012, Viterbo 2014 and Cagliari 2017, the conference is an opportunity for Italian hydrogeologists to exchange ideas and knowledge on different groundwater issues. The objectives of the conference are: To promote dialogue and exchange of scientific knowledge among young hydrogeologists; To deepen the theoretical and practical aspects of our understanding on groundwater; To update all the stakeholders, researchers and professionals on recent challenges in the hydrogeological sciences; To encourage researchers, professionals and administrators to contribute to the improvement of water resources management. This Volume of Conference Proceedings contains the abstracts of oral and poster contributions accepted to FLOWPATH 2019. The abstracts were evaluated by the Scientific and Organizing Committees. This volume contains 99 abstracts submitted by Authors coming from Universities, Public Authorities and Private Companies of Italy and many other countries such as Australia, Belgium, Croatia, Czech Republic, Greece, Hungary, Israel, Malta, Morocco, Nigeria, Spain, Switzerland, The Netherlands, U.K. and U.S.A. The conference focuses on four themes of great importance: 1. Groundwater Resource Management; 2. Fractured Rocks and Karst Aquifers; 3. Contaminated Sites; 4. Urban Hydrogeology. The content of the Conference Proceedings is organized according to the four topics of the conference. The keynote lectures open the sessions, were they were presented, followed by the scientific contributions in alphabetical order by first author's family name.

Artificial Neural Networks in Hydrology

R.S. Govindaraju, A.R. Rao, 2013-03-09. R. S. GOVINDARAJU and ARAMACHANDRA RAO, School of Civil Engineering, Purdue University, West Lafayette, IN, USA. **Background and Motivation** The basic notion of artificial neural networks (ANNs) as we understand them today was perhaps first formalized by McCulloch and Pitts (1943) in their model of an artificial neuron. Research in this field remained somewhat dormant in the early years, perhaps because of the limited capabilities of this method and because there was no clear indication of its potential uses. However, interest in this area

picked up momentum in a dramatic fashion with the works of Hopfield 1982 and Rumelhart et al 1986 Not only did these studies place artificial neural networks on a firmer mathematical footing but also opened the door to a host of potential applications for this computational tool Consequently neural network computing has progressed rapidly along all fronts theoretical development of different learning algorithms computing capabilities and applications to diverse areas from neurophysiology to the stock market Initial studies on artificial neural networks were prompted by a desire to have computers mimic human learning As a result the jargon associated with the technical literature on this subject is replete with expressions such as excitation and inhibition of neurons strength of synaptic connections learning rates training and network experience ANNs have also been referred to as neurocomputers by people who want to preserve this analogy *Advances in Data-based Approaches for Hydrologic Modeling and Forecasting* Bellie Sivakumar, Ronny Berndtsson, 2010 This book comprehensively accounts the advances in data based approaches for hydrologic modeling and forecasting Eight major and most popular approaches are selected with a chapter for each stochastic methods parameter estimation techniques scaling and fractal methods remote sensing artificial neural networks evolutionary computing wavelets and nonlinear dynamics and chaos methods These approaches are chosen to address a wide range of hydrologic system characteristics processes and the associated problems Each of these eight approaches includes a comprehensive review of the fundamental concepts their applications in hydrology and a discussion on potential future directions **Flow and Transport in Porous Formations**

Gedeon Dagan, 2012-12-06 In the mid seventies a new area of research has emerged in subsurface hydrology namely stochastic modeling of flow and transport This development has been motivated by the recognition of the ubiquitous presence of heterogeneities in natural formations and of their effect upon transport and flow on the one hand and by the vast expansion of computational capability provided by electronic machines on the other Apart from this one of the areas in which spatial variability of formation properties plays a cardinal role is of contaminant transport a subject of growing interest and concern I have been quite fortunate to be engaged in research in this area from its inception and to witness the rapid growth of the community and of the literature on spatial variability and its impact upon subsurface hydrology In view of this increasing interest I decided a few years ago that it would be useful to present the subject in a systematic and comprehensive manner in order to help those who wish to engage themselves in research or application of this new field I viewed as my primary task to analyze the large scale heterogeneity of aquifers and its effect presuming that the reader already possesses a background in traditional hydrology This is achieved in Parts 3 4 and 5 of the text which incorporate the pertinent material *Mathematics of Planet Earth* Hans G. Kaper, Fred S. Roberts, 2019-11-01 Since its inception in 2013 Mathematics of Planet Earth MPE focuses on mathematical issues arising in the study of our planet Interested in the impact of human activities on the Earth's system this multidisciplinary field considers the planet not only as a physical system but also as a system supporting life a system organized by humans and a system at risk The articles collected in this volume demonstrate the breadth of techniques

and tools from mathematics statistics and operations research used in MPE Topics include climate modeling the spread of infectious diseases stability of ecosystems ecosystem services biodiversity infrastructure restoration after an extreme event urban environments food security and food safety Demonstrating the mathematical sciences in action this book presents real world challenges for the mathematical sciences highlighting applications to issues of current concern to society Arranged into three topical sections Geo and Physical Sciences Life Sciences Ecology and Evolution Socio economics and Infrastructure thirteen chapters address questions such as how to measure biodiversity what mathematics can say about the sixth mass extinction how to optimize the long term human use of natural capital and the impact of data on infrastructure management The book also treats the subject of infectious diseases with new examples and presents an introduction to the mathematics of food systems and food security Each chapter functions as an introduction that can be studied independently offering source material for graduate student seminars and self study The range of featured research topics provides mathematical scientists with starting points for the study of our planet and the impact of human activities At the same time it offers application scientists a plethora of modern mathematical tools and techniques to address the various topics in practice Including hundreds of references to the vast literature associated with each topic this book serves as an inspiration for further research

Approach to **Entropy Theory and its Application in Environmental and Water Engineering** Vijay P.

Singh, 2013-01-10 Entropy Theory and its Application in Environmental and Water Engineering responds to the need for a book that deals with basic concepts of entropy theory from a hydrologic and water engineering perspective and then for a book that deals with applications of these concepts to a range of water engineering problems. The range of applications of entropy is constantly expanding and new areas finding a use for the theory are continually emerging. The applications of concepts and techniques vary across different subject areas and this book aims to relate them directly to practical problems of environmental and water engineering. The book presents and explains the Principle of Maximum Entropy (POME) and the Principle of Minimum Cross Entropy (POMCE) and their applications to different types of probability distributions. Spatial and inverse spatial entropy are important for urban planning and are presented with clarity. Maximum entropy spectral analysis and minimum cross entropy spectral analysis are powerful techniques for addressing a variety of problems faced by environmental and water scientists and engineers and are described here with illustrative examples. Giving a thorough introduction to the use of entropy to measure the unpredictability in environmental and water systems, this book will add an essential statistical method to the toolkit of postgraduates, researchers and academic hydrologists, water resource managers, environmental scientists and engineers. It will also offer a valuable resource for professionals in the same areas: governmental organizations, private companies as well as students in earth sciences, civil and agricultural engineering and agricultural and rangeland sciences. This book provides a thorough introduction to entropy for beginners and more experienced users. Uses numerous examples to illustrate the applications of the theoretical principles. Allows the reader to apply entropy theory to the solution of practical problems. Assumes minimal existing mathematical knowledge. Discusses the theory and its various aspects in both univariate and bivariate cases. Covers newly expanding areas including neural networks from an entropy perspective and future developments.

Rainfall-Induced Soil Slope Failure Lulu Zhang, Jinhui Li, Xu Li, Jie Zhang, Hong Zhu, 2018-09-03 Rainfall induced landslides are common around the world. With global climate change, their frequency is increasing and the consequences are becoming greater. Previous studies assess them mostly from the perspective of a single discipline: correlating landslides with rainstorms, geomorphology and hydrology in order to establish a threshold prediction value for rainfall induced landslides; analyzing the slope's stability using a geomechanical approach; or assessing the risk from field records. Rainfall Induced Soil Slope Failure: Stability Analysis and Probabilistic Assessment integrates probabilistic approaches with the geotechnical modeling of slope failures under rainfall conditions with unsaturated soil. It covers theoretical models of rainfall infiltration and stability analysis; reliability analysis based on coupled hydro-mechanical modelling; stability of slopes with cracks, gravels and spatial heterogeneous soils; and probabilistic model calibration based on measurement. It focuses on the uncertainties involved with rainfall induced landslides and presents state-of-the-art techniques and methods which characterize the uncertainties and quantify the probabilities and risk of rainfall induced

landslide hazards Additionally the authors cover The failure mechanisms of rainfall induced slope failure Commonly used infiltration and stability methods The infiltration and stability of natural soil slopes with cracks and colluvium materials Stability evaluation methods based on probabilistic approaches The effect of spatial variability on unsaturated soil slopes and more
