About Hypertension
 Hypertension is a chronic condition that causes the blood vessels in the body to narrow. This makes it harder for the heart to pump blood through the vessels. Over time, this can lead to heart disease, stroke, and kidney failure.

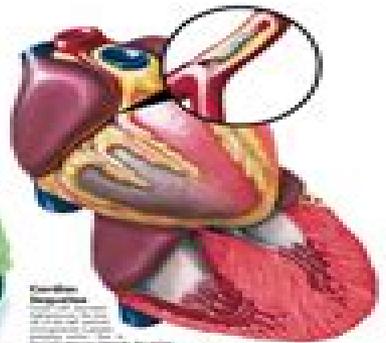

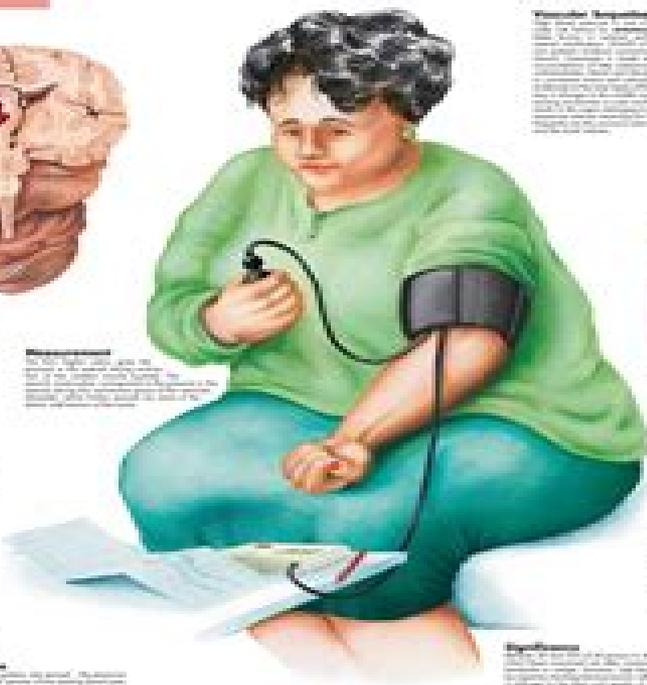

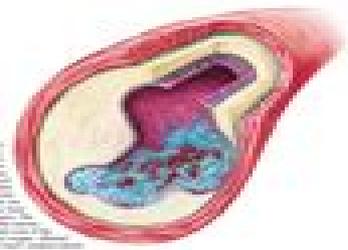

Cerebral Hypertension

Cerebral hypertension is a condition where the blood pressure in the brain is too high. This can lead to a stroke or other brain damage. It is often caused by atherosclerosis or a blood clot in the brain.

Renal Hypertension

Renal hypertension is a condition where the blood pressure is high because of a problem with the kidneys. The kidneys help regulate blood pressure, so if they are not working properly, the blood pressure can rise.

Coronary Hypertension

Coronary hypertension is a condition where the blood pressure is high in the arteries that supply the heart with blood. This can lead to a heart attack or other heart problems.

Diabetic Hypertension

Diabetic hypertension is a condition where the blood pressure is high because of diabetes. Diabetes can damage the blood vessels, leading to high blood pressure.

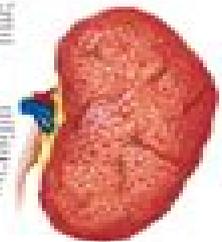

Significance

Hypertension is a major risk factor for heart disease, stroke, and kidney failure. It is often called the "silent killer" because it can be present for years without causing any symptoms.

Renal Hypertension

Renal hypertension is a condition where the blood pressure is high because of a problem with the kidneys. The kidneys help regulate blood pressure, so if they are not working properly, the blood pressure can rise.
