Sequential Methods In Pattern Recognitio:

Sequential Methods in Pattern Recognition and Machine Learning K.C. Fu, 1968 Sequential Methods in Pattern Recognition and Machine Learning **Sequential methods in pattern recognition and machine learning** King S. Fu, 1970 *Sequential Methods in Pattern Recognition and* King Sun Fu, 1968 **Applications of Pattern Recognition** King-Sun Fu, 2019-07-22 This monograph is intended to cover several major applications of pattern recognition After a brief introduction to pattern recognition in Chapter 1 the two major approaches statistical approach and syntactic approach are reviewed in Chapter 2 and 3 respectively Other topics include the application of pattern recognition to seismic wave interpretation to system reliability problems to medical data analysis as well as character and speech recognition

Syntactic Methods in Pattern Recognition, 1974-11-15 In this book we study theoretical and practical aspects of computing methods for mathematical modelling of nonlinear systems A number of computing techniques are considered such as methods of operator approximation with any given accuracy operator interpolation techniques including a non Lagrange interpolation methods of system representation subject to constraints associated with concepts of causality memory and stationarity methods of system representation with an accuracy that is the best within a given class of models methods of covariance matrix estimation methods for low rank matrix approximations hybrid methods based on a combination of iterative procedures and best operator approximation and methods for information compression and filtering under condition that a filter model should satisfy restrictions associated with causality and different types of memory As a result the book represents a blend of new methods in general computational analysis and specific but also generic techniques for study of systems theory and its particular branches such as optimal filtering and information compression Best operator approximation Non Lagrange interpolation Generic Karhunen Loeve transform Generalised low rank matrix approximation Optimal data compression Optimal nonlinear filtering *Computer-Oriented Approaches to Pattern Recognition* Meisel, 1972-07-31

Data Mining: Concepts, Methodologies, Tools, and Applications Management Association, Information Resources, 2012-11-30 Data mining continues to be an emerging interdisciplinary field that offers the ability to extract information from an existing data set and translate that knowledge for end users into an understandable way Data Mining Concepts Methodologies Tools and Applications is a comprehensive collection of research on the latest advancements and developments of data mining and how it fits into the current technological world Digital Pattern Recognition K. S. Fu, 2013-03-08 During the past fifteen years there has been a considerable growth of interest in problems of pattern recognition Contributions to the blossom of this area have come from many disciplines including statistics psychology linguistics computer science biology taxonomy switching theory communication theory control theory and operations

research Many different approaches have been proposed and a number of books have been published Most books published so far deal with the decision theoretic or statistical approach or the syntactic or linguistic approach Since the area of pattern recognition is still far from its maturity many new research results both in theory and in applications are continuously produced The purpose of this monograph is to provide a concise summary of the major recent developments in pattern recognition The five main chapters Chapter 2-6 in this book can be divided into two parts The first three chapters concern primarily with basic techniques in pattern recognition They include statistical techniques clustering analysis and syntactic techniques The last two chapters deal with applications namely picture recognition and speech recognition and understanding Each chapter is written by one or two distinguished experts on that subject The editor has not attempted to impose upon the contributors to this volume a uniform notation and terminology since such notation and terminology does not as yet exist in pattern recognition

Mathematical Models for Speech Technology Stephen Levinson, 2005-03-04

Mathematical Models of Spoken Language presents the motivations for intuitions behind and basic mathematical models of natural spoken language communication A comprehensive overview is given of all aspects of the problem from the physics of speech production through the hierarchy of linguistic structure and ending with some observations on language and mind The author comprehensively explores the argument that these modern technologies are actually the most extensive compilations of linguistic knowledge available Throughout the book the emphasis is on placing all the material in a mathematically coherent and computationally tractable framework that captures linguistic structure It presents material that appears nowhere else and gives a unification of formalisms and perspectives used by linguists and engineers Its unique features include a coherent nomenclature that emphasizes the deep connections amongst the diverse mathematical models and explores the methods by means of which they capture linguistic structure This contrasts with some of the superficial similarities described in the existing literature the historical background and origins of the theories and models the connections to related disciplines e.g. artificial intelligence automata theory and information theory an elucidation of the current debates and their intellectual origins many important little known results and some original proofs of fundamental results e.g. a geometric interpretation of parameter estimation techniques for stochastic models and finally the author's own unique perspectives on the future of this discipline There is a vast literature on Speech Recognition and Synthesis however this book is unlike any other in the field Although it appears to be a rapidly advancing field the fundamentals have not changed in decades Most of the results are presented in journals from which it is difficult to integrate and evaluate all of these recent ideas Some of the fundamentals have been collected into textbooks which give detailed descriptions of the techniques but no motivation or perspective The linguistic texts are mostly descriptive and pictorial lacking the mathematical and computational aspects This book strikes a useful balance by covering a wide range of ideas in a common framework It provides all the basic algorithms and computational techniques and an analysis and perspective which allows one to

intelligently read the latest literature and understand state of the art techniques as they evolve
