Prostaglandins and Leukotrienes Jonathan M. Gerrard, 1985 Prostaglandins and Leukotrienes Jonathan M. Gerrard, **Phylogenesis of Immune Functions** Gregory W. Warr, Nicholas Cohen, 2024-12-20 This volume discusses recent advances in research regarding the evolution of specific and nonspecific defense responses in a taxonomically diverse array of species Topics regarding invertebrates include the protective mechanisms cellular and molecular employed by insects the protective roles of lectins and the self nonself discrimination revealed by tissue incompatibility reactions With vertebrates the evolution of the immunoglobulin related superfamily of recognition molecules including immunoglobulins and the major histocompatibility complex molecules is examined over several chapters Other topics reviewed include the evolution of nonimmunoglobulin mediators of defense e g cytokines and eicosanoids lymphocyte subpopulations including effects of ambient temperature on function and the phylogenetic emergence of natural killer cells **Phylogenesis of Immune Functions** provides invaluable information for evolutionary biologists as well as all immunologists and other researchers interested in discovering how inhabitants in our increasingly threatened biosphere protect themselves against environmental pathogens and toxins Pharmacology of Smooth Muscle Laszlo Szekeres, Julius G. Papp, 2012-12-06 Eighty years have passed since Arthur Heffter the founder of this handbook series invited in 1913 eminent scientists from different parts of the world to contribute At that time 6 10 years were needed to publish the first two volumes which appeared between 1919 and 1923 During these 80 years pharmacology as an independent science has undergone tremendous development which is reflected truly and comprehensively by the ever growing number of volumes in the now classic series of Heffter Heubner's Handbook of Experimental Pharmacology The Editorial Board of distinguished world wide known experienced pharmacologists assumed responsibility for finding and editing the most current and most interesting topics keeping in mind that some evergreen topics should be brushed up from time to time when sufficient new knowledge has accumulated In this sense it is surprising that the highly popular topic of ever growing importance namely pharmacology of smooth muscle has in the knowledge of the editors of this volume never been treated as such Even the of smooth muscle edited by classic volume on the structure and function Billbring Brading Jones and Tomita Smooth Muscle 1981 is more than 12 years old So we think it is justified to say that the present volume really fills a gap We were lucky to be able to invite eminent scientists working in this field and persuade them of the importance of their contributions which cover the most important aspects of this wide ranging topic **Neurochemistry** Albert Teelken, Jaap Korf, 2013-11-11 Proceedings of the 11th European Society for Neurochemistry Meeting held in Groningen The Netherlands June 15 20 1996 Eicosanoids and Radiation Peter Polgar, 2012-12-06 Prostaglandins Leukotrienes and Cancer is a multi volume series that will focus on an emerging area of cancer research In 1968 R H Williams first reported that elevated prostaglandin levels are present in human medullary carcinoma Since that time the concept that arachidonic acid metabolites may be involved in cancer has expanded to include

every aspect of the disease from cell transformation through metastasis Prostaglandins and leukotrienes are generic terms used to describe a family of bioactive lipids produced from unsaturated fatty acids principally from arachidonic acid via the cyclooxygenase and lipoxygenase pathways respectively Cyclooxygenase products consist of diverse products such as prostaglandin E₂ PGE₂ prostacyclin PGI₂ and thromboxane A₂ TXA₂ whereas lipoxygenase products consist of hydroperoxy fatty acids and mono di and tri hydroxy acids including leukotrienes The precursor fatty acids for the cyclooxygenase and lipoxygenase pathways are present in cellular phospholipids This finding established an important control point in their biosynthesis the release of substrate This occurs in response to numerous stimuli that act at the cell surface Dr Bengt Samuelsson's extensive study of the metabolism of prostaglandins indicated that they are rapidly inactivated on a single pass through pulmonary circulation Thus they cannot act as circulating hormones and appear to be made on demand in or in the vicinity of target tissues leading to the concept that prostaglandins are local hormones or autoids

Lipid Signaling in T Cell Development and Function Karsten Sauer, Klaus Okkenhaug, 2015-11-12 Lipids are best known as energy storing molecules and core components of cellular membranes but can also act as mediators of cellular signaling This is most prominently illustrated by the paramount importance of the phospholipase C PLC and phosphoinositide 3 kinase PI3K signaling pathways in many cells including T cells and cancer cells Both of these enzymes use the lipid phosphatidylinositol 4,5-bisphosphate PIP₂ as their substrate PLCs produce the lipid product diacylglycerol DAG and soluble inositol 1,4,5-trisphosphate IP₃ DAG acts as a membrane tether for protein kinase C and RasGRP proteins IP₃ is released into the cytosol and controls calcium release from internal stores The PI3K lipid product phosphatidylinositol 3,4,5-trisphosphate PIP₃ controls signaling by binding and recruiting effector proteins such as Akt and Itk to cellular membranes Recent research has unveiled important signaling roles for many additional phosphoinositides and other lipids The articles in this volume highlight how multiple different lipids govern T cell development and function through diverse mechanisms and effectors In T cells lipids can orchestrate signaling by organizing membrane topology in rafts or microdomains direct protein function through covalent lipid modification or non covalent lipid binding act as intracellular or extracellular messenger molecules or govern T cell function at the level of metabolic regulation The cellular activity of certain lipid messengers is moreover controlled by soluble counterparts exemplified by symmetric PIP₃ inositol 1,3,4,5-tetrakisphosphate IP₄ signaling in developing T cells Not surprisingly lipid producing and metabolizing enzymes have gained attention as potential therapeutic targets for immune disorders leukemias and lymphomas

Porth's Pathophysiology Sheila Grossman, 2013-08-13 Featuring brilliant art engaging new case studies and dynamic new teaching and learning resources this 9th edition of Porth's Pathophysiology Concepts of Altered Health States is captivating accessible and student friendly while retaining the comprehensive nursing focused coverage that has made it a market leader The book's unique emphasis

Diana,2013-03-13

Atherosclerosis is the principal underlying cause of cardiovascular and cerebrovascular disease in people of the Western world Cigarette smoking has been implicated in both the initiation and exacerbation of the atherosclerotic process Data to support this implication derives primarily from epidemiologic studies where the relationship between the incidence of atherosclerosis in people who smoke cigarettes has been shown to have a strong correlation There are few well established explanations for this phenomenon and basic molecular biochemical and cellular mechanisms associated with smoking and the development of atherosclerosis remain both undefined and virtually unexplored Even the epidemiologic correlation between cigarette smoking and the development of atherosclerosis needs further critical studies It is known that individuals who do not smoke cigarettes develop athero sclerosis and it is also known that in people who smoke but have normal or low blood cholesterol lipoprotein levels the incidence of development of atherosclerosis is no different from that which is found in a non

smoking population Answers which explain such observations must address fundamental biological mechanisms Toward this end the purpose of this volume is to assemble in a single publication information which will address the questions what basic cellular and or molecular mechanisms are associated with the development of atherosclerosis and how does cigarette smoking influence such mechanisms to initiate or exacerbate the atherosclerotic process Clearly the development of atherosclerosis is a complex multifactorial biological event Research Awards Index ,1989 **Cumulated Index**
