Prostate Specific Antigen:

The Prostate-specific Antigen (PSA) Test ., 2007 The Great Prostate Hoax Richard J. Ablin, Ronald Piana, 2014-03-04
Reveals how fear based and inaccurate testing is resulting in unnecessary high risk surgeries arguing that the PSA test was never intended for prostate cancer screening *Facts about the Prostate Specific Antigen (PSA) Blood Test and Prostate Cancer* Louisiana State University Health Sciences Center, 2006* **Informed Decision Making About Prostate-Specific Antigen (PSA) Testing: Findings and Implications from Formative Testing of a Multimodal Intervention** Cindy S. Soloe, Lauren A. McCormack, Katherine Treiman, David Driscoll, Shelly Harris, 2009-02-01 We created the You Decide multimodal intervention to provide men with the information skills and reinforcement needed to engage in informed decision making IDM related to prostate cancer screening We developed intervention materials based on three rounds of formative research conducted with 145 members of the intended recipient audience through 10 focus groups and more than 50 individual in depth interviews This report documents key findings from our formative research that may apply to the development of other IDM interventions especially those related to prostate cancer Our findings underscored 1 the difficulty of promoting IDM for cancer screening given people s high affinity for such screenings and 2 the challenge of graphically communicating risk related tradeoffs We found that pretest participants had a preference for full story narratives conveying personal experiences and interpersonal learning opportunities Our formative research findings also supported the need to use plain language to address a range of health literacy levels We describe our efforts to apply these formative research findings in our final intervention materials and discuss implications for future intervention research Our findings underscore the importance of involving the intended audience in the process of developing intervention materials **The Prostate-specific Antigen (PSA) Test** , 2007 **Prostate Specific Antigen and Prostate Cancer** Sudhir Isharwal, Zhou Wang, 2011 Prostate cancer PCa is a disease with high incidence and prevalence Early detection of PCa has been an area for research to decrease its morbidity and mortality The discovery of prostate specific antigen PSA revolutionised screening of PCa which was largely dependent on detection of prostatic acid phosphatase and digital rectal examination Several leading organisations and cancer societies based on present evidence have published their recommendations for its use in detection and monitoring of PCa There has been difference in opinions on its appropriate threshold value to recommend prostate biopsy and benefits on health outcomes due to its use in screening This book presents and discusses current research in the study of PCa and it s role in the screening of prostate cancer Prostate Specific Antigen Michael K. Brawer, Roger S. Kirby, Claus G. Roehrborn, 1999-01-01 The development of serum based assays for the measurement of prostate specific antigen has revolutionized the approach to the management of prostate cancer This advance has however been clouded by concerns about the overdetected of incidental carcinoma with little malignant potential This text discusses the issues highlighted by research into PSA and outlines recommendations for the diagnosis and management of prostatic disease in

This state of the art reference provides a comprehensive review of prostate specific antigen PSA and related prostate markers examining velocity density and age specific reference ranges for increased sensitivity in PSA tumor identification and selection of patient therapies Supplemented with helpful drawings photographs and tables that reinforce and clarify essential issues Considering PSA as a monitor for cancer Prostate Specific Antigen explores PSA levels during radiation chemotherapy and hormone therapy treatments increased PSA levels in older men the effect of acute urinary retention acute bacterial prostatitis and benign prostatic hyperplasia on PSA concentration levels and more With contributions by over 30 internationally distinguished experts and containing nearly 2000 timely references Prostate Specific Antigen is an essential tool for all urologists and urologic surgeons medical urologic and radiation oncologists pathologists clinical chemists and biochemists primary care physicians and fellows residents and medical students in these disciplines **Benefits and Harms of Prostate-specific Antigen Screening for Prostate Cancer** Kenneth Lin,Robert Lipsitz,Supriya Janakiraman,U.S. Preventive Services Task Force,2008 BACKGROUND Prostate cancer is the most common nonskin cancer in men in the United States and prostate cancer screening has increased in recent years In 2002 the U S Preventive Services Task Force concluded that evidence was insufficient to recommend for or against screening for prostate cancer with prostate specific antigen PSA testing PURPOSE To examine new evidence of benefits and harms of screening asymptomatic men for prostate cancer with PSA testing DATA SOURCES English language articles identified in PubMed and the Cochrane Library search dates January 2002 to July 2007 reference lists of retrieved articles and expert suggestions STUDY SELECTION Randomized controlled trials and meta analyses of PSA screening and cross sectional and cohort studies of screening harms and of the natural history of screening detected cancer were selected to answer the following questions Does screening for prostate cancer with PSA as a single threshold test or as a function of multiple tests over time decrease morbidity or mortality What are the magnitude and nature of harms associated with prostate cancer screening other than overtreatment What is the natural history of PSA detected nonpalpable localized prostate cancer DATA EXTRACTION Studies were reviewed abstracted and rated for quality by using predefined U S Preventive Services Task Force criteria DATA SYNTHESIS No good quality randomized controlled trials of screening for prostate cancer have been completed In 1 cross sectional and 2 prospective cohort studies of fair to good quality false positive PSA screening results caused psychological adverse effects for up to 1 year after the test The natural history of PSA detected prostate cancer is poorly understood LIMITATIONS Few eligible studies were identified Long term adverse effects of false positive PSA screening test results are unknown CONCLUSION Prostate specific antigen screening is associated with psychological harms and its potential benefits remain uncertain Prostate cancer is the most common nonskin cancer in U S men An estimated 218 890 men received a new

diagnosis of prostate cancer in 2007 and 1 in 6 men will receive a diagnosis in their lifetime The American Cancer Society estimates that 27 350 men died of prostate cancer in 2006 After peaking in 1991 29 4 deaths per 100 000 men the prostate cancer mortality rate has gradually decreased Although this positive trend may be related to increased screening for prostate cancer other factors including new treatment approaches could also account for some or all of the observed decline in mortality The serum prostate specific antigen PSA test was approved by the U S Food and Drug Administration in 1986 and its use for prostate cancer screening has increased substantially since the mid 1990s However PSA testing is not specific to prostate cancer common conditions such as benign prostatic hyperplasia and prostatitis also increase PSA levels Approximately 1 5 million U S men age 40 to 69 years have a PSA level greater than 4 0 g L a widely used cutoff value for a positive screening result Refinements designed to improve the PSA test s sensitivity and specificity for prostate cancer include determination of PSA density PSA velocity PSA doubling time and percentage of free PSA Potential harms from PSA screening include additional medical visits adverse effects of prostate biopsies anxiety and overdiagnosis the identification of prostate cancer that would never have caused symptoms in the patient s lifetime leading to unnecessary treatment and associated adverse effects Much uncertainty surrounds which cases of prostate cancer require treatment and whether earlier detection leads to improvements in duration or quality of life Two recent systematic reviews of the comparative effectiveness and harms of therapies for localized prostate cancer concluded that no single therapy is superior to all others in all situations In 2002 the U S Preventive Services Task Force USPSTF found insufficient evidence to recommend for or against routine screening for prostate cancer The USPSTF found good evidence that PSA screening can detect early stage prostate cancer but found mixed and inconclusive evidence that screening and early detection improve health outcomes Consequently the USPSTF was unable to determine the balance between benefits and harms of periodic screening for prostate cancer The analytic framework that guided the previous USPSTF evidence review Figure included 8 key questions about benefits and harms of prostate cancer screening and treatment This evidence update focuses on critical gaps in the evidence that the Task Force identified in the previous review the lack of good quality studies linking screening to improved health outcomes limited information about harms of screening and a paucity of knowledge about the natural history of PSA detected nonpalpable localized prostate cancer the most common type of prostate cancer detected today These evidence gaps produced 3 new key questions for this update 1 Does screening for prostate cancer with PSA as a single threshold test or as a function of multiple tests over time decrease morbidity or mortality 2 What are the magnitude and nature of harms associated with prostate cancer screening other than overtreatment 3 What is the natural history of PSA detected nonpalpable localized prostate cancer

Early Detection of Prostate Cancer, An Issue of Urologic Clinics Stacy Loeb, 2014-05-28 PSA screening remains highly controversial due to several important disadvantages More PSA is produced with prostatic enlargement and in other benign conditions such as urinary tract infections False positive tests can then lead to unnecessary diagnostic workup with invasive prostate biopsy Another major problem with screening programs in general is overdiagnosis of cancers that would not have caused harm during the patient's lifetime For example many prostate cancers have a relatively indolent behavior so may not require diagnosis or treatment in a patient with limited life expectancy All forms of prostate cancer treatment have potential urinary and sexual side effects so reducing overdiagnosis and overtreatment are critical public health issues Because screening has many proven benefits but also significant harms there are widely disparate guidelines on prostate cancer screening from major organizations worldwide This issue of the Urologic Clinics will provide insights into the many different prostate cancer guidelines and related policy issues
