Protostars and Planets VI Henrik Beuther, Ralf S. Klessen, Cornelis Petrus Dullemond, Thomas K. Henning, 2014-12-18
Proceedings of a conference held in Heidelberg Germany July 15 20 2013 **Protostars and Planets V** Bo Reipurth, David Jewitt, Klaus Keil, 2007 Protostars and Planets V builds on the latest results from recent advances in ground and space based astronomy and in numerical computing techniques to offer the most detailed and up to date picture of star and planet formation including the formation and early evolution of our own solar system **PROTOSTARS AND PLANETS VII.** , 2023

Protostars and Planets VII Shu-ichiro Inutsuka, Yuri Aikawa, Takayuki Muto, Kengo Tomida, Motohide Tamura, 2023 This Protostars and Planets VII volume shows the current understanding of the formation of stars and planets covering various aspects of molecular cloud and star formation protoplanetary disk planetary systems and astrophysical conditions for life A decade gap between PP6 and PP7 corresponds to substantial progress in theory and observations Observations of protoplanetary disks by radio interferometers and other high spatial resolution telescopes have provided many fantastic images that are stimulating theoretical investigations in the context of planet formation The advent of modern polarimetry observations in millimeter and sub millimeter wavelengths that enable the magnetic field line measurement in the interstellar clouds and the radio wavelength scattering by the relatively large dust grains in protoplanetary disks Ground based and space observations of exo planets provide a large statistical database for the study of planet formation The sample return missions of the small bodies in Solar System have provided direct insight into the composition of primordial materials This PP7 book is expected to serve as an essential resource for our understanding of the formation of stars and planets Summary taken from HTML volume listing page **Protostars & Planets** Tom Gehrels, Mildred Shapley Matthews, 1978 Unique source book on star formation and the origin of planetary systems from some 35 distinguished authors Topics include the formation of stars from the cloudy to the stellar to the planetary state Special emphasis on stars believed capable of producing planets **Protostars and Planets** Tom Gehrels, 1978 *Protostars & Planets* Tom Gehrels, Mildred Shapley Matthews, 1978 **Protostars & Planets II** David C. Black, Mildred Shapley Matthews, 1985 **Protostars and Planets IV** Vincent Mannings, Alan Boss, Sara Samantha Russell, 2000 Click here for the online version of this book This title out of print in 2008 is now available free of charge in its entirety online through the University of Arizona Press Both a textbook and a status report for every facet of research into the formation of stars and planets Protostars and Planets IV brings together 167 authors who report on the most significant advances in the field since the publication of the previous volume in 1993 Protostars and Planets IV reflects improvements in observational techniques and the availability of new facilities such as the Infrared Space Observatory the refurbished Hubble Space Telescope and the 10 m Keck telescopes Advances in computer technology and modeling methods have benefited theoretical studies of molecular clouds star formation and jets and disks while recent analyses of meteorites yield important insights into conditions and processes within our Sun's early

protoplanetary disk The 49 chapters describe context and progress for observational and theoretical studies of the structure chemistry and dynamics of molecular clouds the collapse of cores and the formation of protostars the formation and properties of young binary stars the properties of winds jets and molecular outflows from young stellar objects the evolution of circumstellar envelopes and disks grain growth in disks and the formation of planets and the properties of the early Solar nebula Protostars and Planets IV is also the first book to include chapters describing the discoveries of extrasolar planets brown dwarfs and Edgeworth Kuiper Belt objects and the first to include high resolution optical and near infrared images of protoplanetary disks Protostars and Planets IV is an unsurpassed reference not only for established researchers but also for younger scientists whose imagination and work will lead to tomorrow s discoveries **Protostars and Planets III** Eugene Howard Levy,Jonathan Irving Lunine,1993 Previous Space Science Series volumes Protostars and Planets 1978 and Protostars and Planets II 1985 were among the most timely offerings of this illustrious collection of technical works Now Protostars and Planets III continues to address fundamental questions concerning the formation of stars and planetary systems in general and of our solar system in particular Drawing from recent advances in observational experimental and theoretical research it summarizes our current understanding of these processes and addresses major open questions and research issues Among the more notable subjects covered in the more than three dozen chapters are the collapse of clouds and the formation and evolution of stars and disks nucleosynthesis and star formation the occurrence and properties of disks around young stars T Tauri stars and their accretion disks gaseous accretion and the formation of the giant planets comets and the origin of the Solar System and the long term dynamical evolution and stability of the solar system Protostars and Planets III reflects the enormous progress made in understanding star and planet formation as a result of new observational capabilities and cooperative research among scientists from diverse fields As new discoveries continue to be made it will stand as an unparalleled reference for tomorrow s research **Protostars and Planets V** ,2005 **The Outer Planets and their Moons** Therese Encrenaz,R. Kallenbach,Tobias Owen,Christophe Sotin,2005-07-05 Representatives of several scientific communities such as planetary scientists astronomers space physicists chemists and astrobiologists have met with the aim to review the knowledge on four major themes 1 the study of the formation and evolution processes of the outer planets and their satellites beginning with the formation of compounds and planetesimals in the solar nebula and the subsequent evolution of the interiors of the outer planets 2 a comparative study of the atmospheres of the outer planets and Titan 3 the study of the planetary magnetospheres and their interactions with the solar wind and 4 the formation and properties of satellites and rings including their interiors surfaces and their interaction with the solar wind and the magnetospheres of the outer planets Beyond these topics the implications for the prebiotic chemical evolution on Europa and Titan are reviewed At the time of publication the study of the outer planets is particularly motivated by the fact that the Saturn system is being investigated by the Cassini Huygens mission **Protostars and Planets III.** Eugene H. Levy,1993

Comets II M. Festou, H. U. Keller, Harold A. Weaver, 2004-11 The study of comets is a field that has seen tremendous advances in recent years far surpassing the knowledge reflected in the original Comets volume published as part of the Space Science Series in 1982 This new volume with more than seventy contributing authors represents the first complete overview of comet science in more than a decade and contains the most extensive collection of knowledge yet assembled in the field Comets II situates comet science in the global context of astrophysics for the first time by beginning with a series of chapters that describe the connection between stars and planets It continues with a presentation of the formation and evolution of planetary systems enabling the reader to clearly see the key role played in our own solar system by the icy planetesimals that were the seeds of the giant planets and transneptunian objects The book presents the key results obtained during the 1990s in particular those collected during the apparition of the exceptional comets C Hyakutake and C Hale Bopp in 1996 1997 The latest results obtained from the in situ exploration of comets P Borrelly and P Wild 2 are also discussed in detail Each topic is designed to be accessible to students or young researchers looking for basic yet detailed complete and accurate information on comet science With its emphasis on the origin of theories and the future of research Comets II will enable scientists to make connections across disciplinary boundaries and will set the stage for discovery and new understanding in the coming years Physical Processes in Circumstellar Disks Around Young Stars Paulo J. V.

Garcia, 2011-05-15 Circumstellar disks are vast expanses of dust that form around new stars in the earliest stages of their birth Predicted by astronomers as early as the eighteenth century they weren't observed until the late twentieth century when interstellar imaging technology enabled us to see nascent stars hundreds of light years away Since then circumstellar disks have become an area of intense study among astrophysicists largely because they are thought to be the forerunners of planetary systems like our own the possible birthplaces of planets This volume brings together a team of leading experts to distill the most up to date knowledge of circumstellar disks into a clear introductory volume Understanding circumstellar disks requires a broad range of scientific knowledge including chemical processes the properties of dust and gases hydrodynamics and magnetohydrodynamics radiation transfer and stellar evolution all of which are covered in this comprehensive work which will be indispensable for graduate students seasoned researchers or even advanced undergrads setting out on the study of planetary evolution **Comparative Planetology with an Earth Perspective** Moustafa T.

Chahine, Michael F. A'Hearn, Jürgen H. Rahe, 2013-04-17 The systematic study of the planets has experienced a slow but steady progress from the efforts of a single individual Galileo Galilei 1564 1642 to nations that individually and collectively create whole agencies and complex infrastructures devoted to the exploration and understanding of our solar system This quest for knowledge continues in earnest today as we attempt to understand Earth's unique place among its closest neighbors Known diversities emphasize fractionation processes that may have occurred in the nebula during early solar system formation and the vastly different evolutionary paths taken by the planets and their satellites The discovery of

similarities and differences among the planets has given rise to a discipline of Comparative Planetology Here terrestrial properties and giant planet atmospheres are viewed and probed surface geologies are related to atmospheres and oceans interior structures are envisioned magnetic fields mapped and bizarre differences in satellites and ring systems continue to enlighten amaze and confound the detectives of planetary science A science organizing committee with international participation was formed to develop a conference program to address the basic issues and the fundamental processes that are common among the planets The goals of the meeting were twofold first the production of a reference source on comparative planetology for academia and second the provision of an impetus for NASA to begin a program devoted to this emerging science discipline The conference program accommodated seventeen invited papers and nineteen poster presentations

One of Ten Billion Earths Karel Schrijver, 2018-06-28 Illustrated with breathtaking images of the Solar System and of the Universe around it this book explores how the discoveries within the Solar System and of exoplanets far beyond it come together to help us understand the habitability of Earth and how these findings guide the search for exoplanets that could support life The author highlights how within two decades of the discovery of the first planets outside the Solar System in the 1990s scientists concluded that planets are so common that most stars are orbited by them The lives of exoplanets and their stars as of our Solar System and its Sun are inextricably interwoven Stars are the seeds around which planets form and they provide light and warmth for as long as they shine At the end of their lives stars expel massive amounts of newly forged elements into deep space and that ejected material is incorporated into subsequent generations of planets How do we learn about these distant worlds What does the exploration of other planets tell us about Earth Can we find out what the distant future may have in store for us What do we know about exoworlds and starbirth and where do migrating hot Jupiters polluted white dwarfs and free roaming nomad planets fit in And what does all that have to do with the habitability of Earth the possibility of finding extraterrestrial life and the operation of the globe spanning network of the sciences

High Resolution Infrared Spectroscopy in Astronomy Hans Ulrich Käufl, R. Siebenmorgen, Alan F.M. Moorwood, 2005-07-18 Two specialized new instruments for ESO's VLT VISIR and CRIRES spawned the idea for this workshop CRIRES is a dedicated very high resolution infrared spectrograph VISIR features a high resolution spectroscopic mode Together the instruments combine the sensitivity of an 8m telescope with the now well established reliability of VLT facility instruments High resolution here means that lines in cool stellar atmospheres and HII regions can be resolved The astrophysical topics discussed in this rather specialized workshop range from the inner solar system to active galactic nuclei There are many possibilities for new discoveries with these instruments but the unique capability which becomes available through high resolution infrared spectroscopy is the observation of molecular rotational vibrational transitions in many astrophysical environments Particularly interesting and surprising in this context many papers on modeling and laboratory spectroscopy at the workshop appear to indicate that astronomical observations are lagging a bit behind in this field The

papers are an interesting mix of reports from existing high resolution facilities reports on modeling efforts of synthetic spectra and reports on laboratory spectra In this sense a fruitful exchange between molecular physics and astronomy was again accomplished and is documented in this volume *Astronomie spatiale infrarouge, aujourd'hui et demain Infrared space astronomy, today and tomorrow* F. Casoli, J. Lequeux, F. David, 2003-07-01 This book brings together the lectures given at the Les Houches summer school Infrared space astronomy today and tomorrow It gives a wide overview of infrared astronomy a wavelength domain crucial for studies of the solar system stars at the beginning and end of their lives interstellar matter and galaxies at all distances Recent developments in observational techniques have been tremendous The first contributions give an introduction to the basic physical processes and methods of detection and data processing They are followed by a series of lectures dealing with the wide variety of astronomical objects that can be seen in the infrared

Cosmical Magnetism D. Lynden-Bell, 2012-12-06 Prof Leon Mestel has been an inspiration to many to study the role of magnetism in the Cosmos To mark the occasion of his retirement from the University of Sussex after 43 years in astrophysics several of his friends and former students decided to hold an advanced research workshop in his honour NATO agreed to finance this venture which was held at the Institute of Astronomy at Cambridge The scientific organizing committee was J Landstreet D Lynden Bell F Pacini M A Ruderman and N O Weiss and most leading experts on Cosmical magnetism agreed to come We are particularly grateful to Lyman Spitzer who ably helped by his wife Doreen gave the after dinner address on how the goddess Astrophysica had foreseen Leon's achievements in classical Greek times Not without regret we decided to maintain the homogeneity of the material and therefore could not cover Leon Mestel's major achievements in non magnetic astronomy His work on the cooling of white dwarfs his understanding that degenerate hydrogen was a nuclear explosive since its pressure was almost independent of temperature and hence his picture of supernovae which is now more commonly applied to novae his seminal understanding of the law of galactic rotation and his work on the non linear development of the anisotropies generated in gravitational collapse
