

# Psychiatric States in Adults With Minimal Brain Dysfunction

By LEOPOLD BELLAK, M.D.

**M**inimal brain dysfunction (MBD) has been studied in children for several years, but it is only recently that its significance in adult psychiatric states has become recognized. When it plays an etiologic, pathogenic, or merely concurrent role, its coexistence with other adult disorders is of diagnostic, therapeutic, and prognostic importance to the psychiatrist. In the following article, I shall discuss its manifestations in the adult psychiatric patient and indicate diagnostic and treatment modalities.

At the outset, it must be stated that MBD is a multifaceted disorder that interacts subtly and in quite variable ways in different people, according to the psychodynamic and structural aspects of their personality. Its diverse manifestations have led to an abuse of the concept, particularly in some school systems, with the result that the validity of MBD as a nosologic entity has fallen into disrepute with some clinicians.\*

But it does exist, and the name describes a

syndrome that has played an important part in psychiatric disorders of adults. Cognitive functioning — including the registration, storing, and retrieval of experiences — is, of course, affected by any dysfunction in any of the organs involving sense perception. And the person with MBD suffers such distortions, not only in the initial perception of experiences but also in their subsequent recording and recall. Thus the effects of MBD on adult personality development cannot be disregarded by anyone searching for the experiential factors generally considered basic for psychiatric disorders.

The MBD symptoms fairly well recognized in children seem to have escaped attention in adults with the syndrome — no doubt because when the child with MBD reaches puberty, most of the overt symptoms that brought him to
