

Influence of the Teacher-Student Relationship on Childhood Conduct Problems: A Prospective Study

Examined the influence of the quality of the teacher-student relationship on children's subsequent levels of aggression in a sample of 61 second and third-grade children nominated and rated by teachers as aggressive. The stability of teachers' and children's reports of relationship quality across academic years was in the low to moderate range. Teachers and children showed little agreement in their reports of relationship quality. Teachers' and children's reports of relationship quality in Year 1 (Y1) predicted teacher-rated aggression the following year, controlling for Y1 ratings of aggression. Teachers' reports of relationship quality across Y1 and Y2 predicted peer-rated aggression, but not teacher-rated aggression, in Y3, controlling for Y1 aggression. Consistent with a buffering role for teacher-student relationships, a positive teacher-student relationship was of greatest benefit to children whose mothers reported rejecting parenting histories. We discuss implications for school-based prevention programs.

Childhood aggression is one of the most extensively researched topics in the social sciences. The quest for effective early interventions with aggressive children is based on the strong association between early aggression and subsequent psychopathology, including delinquency, substance abuse, school failure, and criminality (see Loeber, 1990, for review). Although aggression shows high stability from early childhood through adulthood, not all children continue along antisocial pathways (Loeber et al., 1993). Approximately one half of boys who meet the criteria for a diagnosis of conduct disorder in one year no longer meet the criteria 1 to 4 years later (Lahey et al., 1995). These findings suggest the importance of identifying factors that may deflect children from aggressive trajectories. Recently, several researchers identified with diverse theoretical orientations have suggested that a close and accepting relationship with a teacher may exert an ameliorative influence on the development of children at risk for behavioral problems (Connell & Wellborn, 1991; Greene, 1995; Hawkins & Lam, 1987; Howes, Hamilton, & Matheson, 1994; Howes, Matheson, & Hamilton, 1994; Pianta, in press; Pianta, Steinberg, & Rollins,

1995; Ryan, Stiller, & Lynch, 1994). Conversely, a teacher-student relationship characterized by high levels of conflict and controlling interactions and low levels of warmth and acceptance may serve to increase a child's risk for school maladjustment (Pianta et al., 1995).

Because teachers generally have a low tolerance for aggressive and socially defiant behavior (Cunningham & Sugawara, 1988; Safran & Safran, 1987), their interactions with these children are often angry, critical, and punishing (Coie & Koeppl, 1990; Walker & Buckley, 1973). Behaviorally disordered children are thus more likely than their peers to experience teaching that is less responsive as well as lacking in warmth, nurturance, and encouragement (Itskowitz, Navon, & Strauss, 1988; Sroufe, 1983). For example, Fry (1983) found that acting-out children were the targets of more negative teacher affect in combination with less sustaining feedback. Despite the challenges to a positive relationship posed by children with behavioral difficulties, some teachers are successful in establishing and maintaining warm and close relationships with them. Theorists have suggested that mismatches between behaviorally difficult children's interactional styles and needs and teachers' expectations, discipline approaches, and interpersonal traits negatively impact the quality of teacher-student relationships, resulting in an escalation in the child's adjustment difficulties (Greene, 1995; Walker & Rankin, 1983; Wong, Kauffman, & Lloyd, 1991). However, the influence of

different perspectives With some volumes by very eminent thinkers this is a great addition to any collection on philosophy

Transformation - A Fundamental Idea of Mathematics Education Sebastian Rezat, Mathias Hattermann, Andrea Peter-Koop, 2013-12-13 The diversity of research domains and theories in the field of mathematics education has been a permanent subject of discussions from the origins of the discipline up to the present On the one hand the diversity is regarded as a resource for rich scientific development on the other hand it gives rise to the often repeated criticism of the discipline's lack of focus and identity As one way of focusing on core issues of the discipline the book seeks to open up a discussion about fundamental ideas in the field of mathematics education that permeate different research domains and perspectives The book addresses transformation as one fundamental idea in mathematics education and examines it from different perspectives Transformations are related to knowledge related to signs and representations of mathematics related to concepts and ideas and related to instruments for the learning of mathematics The book seeks to answer the following questions What do we know about transformations in the different domains What kinds of transformations are crucial How is transformation in each case conceptualized

Human Awareness Ivana Marková, 2017-03-27 Human awareness which forms the basis of all interpersonal relationships is perhaps the most fascinating phenomenon of biological and socio cultural evolution In this innovative book originally published in 1987 the author introduces the subject of human awareness from the perspective of developmental and social psychology Using a wide range of psychological and other sources both classic and more recent from around the world the book begins with a discussion of awareness as a biological and cultural historical phenomenon The reader is then guided through such issues as one's awareness of others self awareness interpersonal communication and the search of human beings for recognition by others The final chapter focuses on human awareness as a relationship between the self and society with particular emphasis on social stability and change Human Awareness provided the first comprehensive account of human consciousness in a text that reflected the most exciting recent research in the field at the time and emphasized the need for an integrated and coherent understanding of the various psychological disciplines

Emergent Forms Eugene Curtis Goldfield, 1995 While it is often assumed that behavioral development must be based upon both physical law and the biological principles of morphogenesis and selection forging a link between these phenomena has remained an elusive goal Now in Emergent Forms psychologist Eugene C Goldfield offers an exciting new theoretical framework based in part on the concept of self organization that promises to aid researchers in their quest to discover the underlying origins and processes of behavioral development Addressing the question of how familiar human functional acts such as eating walking manipulating objects and smiling emerge during infancy Goldfield proposes that during perceptually guided spontaneous activity a variety of biodynamic devices for doing different kinds of work are assembled and adapted to specific tasks Throughout the theory is examined in the context of development and extended to atypical development and other domains such as cognition and language The author also addresses many long standing issues in behavioral

development including the apparent disappearance of so called primitive behaviors the emergence of new skills and the role of the caregiver in skill acquisition The author concludes his work by discussing how the implications of this research can be applied to understanding abnormal development in children who are motor impaired Interdisciplinary in scope and accessible to a broad range of readers Emergent Forms will fascinate students and researchers of ecological developmental
