Image-Guided Radiotherapy for Effective Radiotherapy Delivery Nam Phong Nguyen,Ulf Lennart Karlsson,2016-04-22 Image guided

radiotherapy IGRT is a new radiotherapy technology that combines the rapid dose fall off associated with intensity modulated radiotherapy IMRT and daily tumor imaging allowing for high precision tumor dose delivery and effective sparing of surrounding normal organs. The new radiation technology requires close collaboration between radiologists, nuclear medicine specialists and radiation oncologists to avoid marginal miss. Modern diagnostic imaging such as positron emission tomography PET scans, positron emission tomography with Computed Tomography PET CT and magnetic resonance imaging MRI allows the radiation oncologist to target the positive tumor with high accuracy. As the tumor is well visualized during radiation treatment, the margins required to avoid geographic miss can be safely reduced, thus sparing the normal organs from excessive radiation. When the tumor is located close to critical radiosensitive structures such as the spinal cord, IGRT can deliver a high dose of radiation to the tumor and simultaneously decrease treatment toxicity, thus potentially improving cure rates and patient quality of life. During radiotherapy, tumor shrinkage and changes of normal tissues volumes can be detected daily with IGRT. The volume changes in the target volumes and organs at risk often lead to increased radiation dose to the normal tissues and if left uncorrected may result in late complications. Adaptive radiotherapy with re-planning during the course of radiotherapy is therefore another advantage of IGRT over the conventional radiotherapy techniques. This new technology of radiotherapy delivery provides the radiation oncologist an effective tool to improve patient quality of life. In the future, radiation dose escalation to the residual tumor may potentially improve survival rates. Because the treatment complexity, a great deal of work is required from the dosimetry staff and physicists to ensure quality of care. Preliminary clinical results with IGRT are encouraging but more prospective studies should be performed in the future to assess the effectiveness of IGRT in improving patient quality of life and local control. In this Frontiers Research Topic, we encourage submission of original papers and reviews dealing with imaging for radiotherapy planning, the physics and dosimetry associated with IGRT as well as the clinical outcomes for cancer treatment with IGRT for all tumor sites.

Image-Guided and Adaptive Radiation Therapy Robert D. Timmerman, Lei Xing, 2012-10-09 This book provides detailed state of the art information and guidelines on the latest developments, innovations and clinical procedures in image guided and adaptive radiation therapy. The first section discusses key methodological and technological issues in image guided and adaptive radiation therapy including use of implanted fiducial markers, management of respiratory motion, image guided stereotactic radiosurgery and stereotactic body radiation therapy, three dimensional conformal brachytherapy, target definition and localization and PET CT and biologically conformal radiation therapy. The second section provides practical clinical information on image guided adaptive radiation therapy for cancers at all common anatomic sites and for pediatric cancers. The third section offers practical guidelines for establishing an effective image guided adaptive radiation therapy program.

Image-guided Radiation Therapy Arno J. Mundt, John C. Roeske, 2010-12-31 Image Guided Radiation Therapy IGRT is a true revolution in the field of radiation oncology. IGRT provides the unprecedented means of conforming dose to the shape of

the target tissues in 3 dimensions reducing the risk of complications thereby improving the quality of life of irradiated patients Moreover IGRT provides the means to deliver higher than conventional doses thus improving the chance of cure in these patients Despite its established benefits several barriers exist to the widespread clinical implementation of IGRT In the past great concerns existed regarding the large capital outlay needed for both software and hardware This barrier is less relevant today given the increased reimbursements possible with IGRT Today the most significant barrier is education IGRT is a fundamentally new approach to both treatment planning and delivery Adoption of the IGRT approach entails new ways of thinking in regard to patient selection treatment planning and quality assurance measures Unfortunately apart from a few University based short courses limited resources are available for the physician and physicist interested in learning IGRT
