## **Pathogenesis And Mechanisms Of Liver Cell Necrosis:**

**Pathogenesis and Mechanisms of Liver Cell Necrosis** D. Keppler, 2012-12-06 The pathogenesis of cell death and necrosis in the liver is a central topic of research in liver disease. A molecular understanding of events and sequences leading to cellular death provides the basis for preventive and therapeutic efforts. This volume originates from a Workshop on Experimental Liver Injury held on November 9 and 10 1974 in Freiburg, Germany. Recent progress in the elucidation of the mode of action includes agents inducing liver cell necrosis by a primary disturbance of nucleotide and nucleic acid metabolism as well as hepatotoxins characterized by a primary attack on cellular membranes. I hope that this book will contribute to an increasing understanding of disease mechanisms. Freiburg im Breisgau Dietrich Keppler June 1975

**Liver Pathophysiology** Pablo Muriel, 2017-03-02 Liver Pathophysiology: Therapies and Antioxidants is a complete volume on morphology, physiology, biochemistry, molecular biology, and treatment of liver diseases. It uses an integral approach towards the role of free radicals in the pathogenesis of hepatic injury and how their deleterious effects may be abrogated by the use of antioxidants. Written by the most prominent authors in the field, this book will be of use to basic and clinical scientists and clinicians working in the biological sciences, especially those dedicated to the study and treatment of liver pathologies. Presents the most recent advances in hepatology with a special focus on the role of oxidative stress in liver injury. Provides in vivo and in vitro models to study human liver pathology. Explains the beneficial effects of antioxidants on liver diseases. Contains the most recent and modern treatments of hepatic pathologies, including but not limited to stem cells, repopulation, gene therapy, and liver transplantation.

**Cellular and Molecular Mechanisms Underlying the Pathogenesis of Hepatic Fibrosis** Ralf Weiskirchen, 2020-12-29 Worldwide liver fibrosis is a major cause of morbidity and mortality and is associated with a high medical and economic burden. It is the common consequence of chronic liver injury due to various etiologies. During fibrogenesis, there is a progressive substitution of the liver parenchyma by scar tissue. Recent advances in the understanding of the history of liver fibrosis have shown that the pathogenesis is driven by different cell types and a large variety of soluble mediators. At present, scientists working in this field aim to increase basic knowledge, improve diagnostics, and try to translate experimental findings into new treatment modalities. This book includes 12 selected contributions from the Special Issue Cellular and Molecular Mechanisms Underlying the Pathogenesis of Hepatic Fibrosis that was published in Cells. These articles summarize current perspectives and findings in hepatic fibrosis research, showing how scientists try to use basic scientific research to create new therapies and diagnostics.
