Patient Controlled Analgesia:

Patient Controlled Analgesia (PCA) F. Gurule, Judith A. Fabian, VA Medical Center (Albuquerque, N.M.), 1993 **Opioids in Pain Control** Christoph Stein, 1999 This book offers a comprehensive overview of scientific developments and clinical implications surrounding the use of opioids in pain control **Demystifying Opioid Conversion Calculations: A Guide for Effective Dosing** Mary Lynn McPherson, 2009-08-24 Have you ever wondered if you calculated your patient's dosage correctly? Against a backdrop of the growing scrutiny of appropriate dosages, this textbook takes a fresh new approach to helping health professionals strengthen care to and possibly save the lives of patients living with pain. This easy to understand and often humorous book is the most comprehensive to date on opioid calculations for pain management and palliative care. It carefully walks clinicians through a five step process for performing opioid conversion calculations in the real world situations they often see. The book has case examples, simple charts and tables, and practice problems throughout on topics such as difficult conversions for methadone, fentanyl PCA, and neuraxial opioid therapy, conversions between routes, and dosage formulations of the same opioids and different opioids, titrating opioid dosages up and down to include dosage change and timing, calculating doses for rescue opioid therapy. Written by pain management expert Dr. Mary Lynn McPherson, the book gives helpful tips that practitioners should incorporate into their practices. It is a must for clinicians at all levels: hospice and palliative care physicians, physicians' assistants, nurses, nurse practitioners, and pharmacists. Clinicians will come away with more confidence in doing the calculations and higher service levels from the improvement in care.

Patient-controlled Analgesia for Acute Injury Transfers, 2014 Patient controlled analgesia (PCA) refers to the use of a medical device that delivers defined doses of pain medication to a patient on demand. Specific doses are programmed by a health care professional, and the device is also programmed to limit the administration of each dose or a cumulative amount of drug within certain time intervals. PCA typically involves intravenous opioid delivery but may include other drugs such as non-steroidal anti-inflammatory drugs or local anaesthesia or other routes of administration, for example subcutaneous, transdermal, pulmonary, or nasal administration. It is commonly used for post-operative pain, but PCA for acute pain management in the hospital emergency department has also been studied. It has been documented that acute pain is not adequately controlled in patients in pre-hospital emergency care settings. This observation of suboptimal pain management may extend to situations in which patients who require transfer from a rural or remote hospital to a higher level of care are in emergency vehicles for up to several hours. In some jurisdictions, ambulances are staffed by paramedics with basic life support training; doctors and nurses are not available to administer analgesics. Therefore, there is a potential role for PCA to provide sufficient acute pain management in this setting. The purpose of this report is to review the evidence of the clinical effectiveness and guidelines regarding PCA for patients with acute injury during transfer to a higher level of care.
