Rao,Bruno A. Olshausen,Michael S. Lewicki,2002-03-29 A survey of probabilistic approaches to modeling and understanding brain function Neurophysiological neuroanatomical and brain imaging studies have helped to shed light on how the brain transforms raw sensory information into a form that is useful for goal directed behavior A fundamental question that is seldom addressed by these studies however is why the brain uses the types of representations it does and what evolutionary advantage if any these representations confer It is difficult to address such questions directly via animal experiments A promising alternative is to use probabilistic principles such as maximum likelihood and Bayesian inference to derive models of brain function This book surveys some of the current probabilistic approaches to modeling and understanding brain function Although most of the examples focus on vision many of the models and techniques are applicable to other modalities as well The book presents top down computational models as well as bottom up neurally motivated models of brain function The topics covered include Bayesian and information theoretic models of perception probabilistic theories of neural coding and spike timing computational models of lateral and cortico cortical feedback connections and the development of receptive field properties from natural signals **Fuzzy-Neuro Systems '98** Wilfried Brauer,1998 *Computer Vision Metrics* Scott Krig,2014-06-14 Computer Vision Metrics provides an extensive survey and analysis of over 100 current and historical feature description and machine vision methods with a detailed taxonomy for local regional and global features This book provides necessary background to develop intuition about why interest point detectors and feature descriptors actually work how they are designed with observations about tuning the methods for achieving

robustness and invariance targets for specific applications The survey is broader than it is deep with over 540 references provided to dig deeper The taxonomy includes search methods spectra components descriptor representation shape distance functions accuracy efficiency robustness and invariance attributes and more Rather than providing how to source code examples and shortcuts this book provides a counterpoint discussion to the many fine opencv community source code resources available for hands on practitioners

Artificial Neural Networks in Biomedicine Paulo J.G. Lisboa, Emmanuel C. Ifeachor, Piotr S. Szczepaniak, 2012-12-06 Following the intense research activities of the last decade artificial neural networks have emerged as one of the most promising new technologies for improving the quality of healthcare Many successful applications of neural networks to biomedical problems have been reported which demonstrate convincingly the distinct benefits of neural networks although many of these have only undergone a limited clinical evaluation Healthcare providers and developers alike have discovered that medicine and healthcare are fertile areas for neural networks the problems here require expertise and often involve non trivial pattern recognition tasks there are genuine difficulties with conventional methods and data can be plentiful The intense research activities in medical neural networks and allied areas of artificial intelligence have led to a substantial body of knowledge and the introduction of some neural systems into clinical practice An aim of this book is to provide a coherent framework for some of the most experienced users and developers of medical neural networks in the world to share their knowledge and expertise with readers
