Pattern Recognition with Neural Networks in C++ Abhijit S. Pandya,Robert B. Macy,1995-10-17 The addition of artificial neural network computing to traditional pattern recognition has given rise to a new different and more powerful methodology that is presented in this interesting book This is a practical guide to the application of artificial neural networks Geared toward the practitioner Pattern Recognition with Neural Networks in C covers pattern classification and neural network approaches within the same framework Through the book s presentation of underlying theory and numerous practical examples readers gain an understanding that will allow them to make judicious design choices rendering neural application predictable and effective The book provides an intuitive explanation of each method for each network paradigm This discussion is supported by a rigorous mathematical approach where necessary C has emerged as a rich and descriptive means by which concepts models or algorithms can be precisely described For many of the neural network models discussed C programs are presented for the actual implementation Pictorial diagrams and in depth discussions explain each topic Necessary derivative steps for the mathematical models are included so that readers can incorporate new ideas into their programs as the field advances with new developments For each approach the authors clearly state the known theoretical results the known tendencies of the approach and their recommendations for getting the best results from the method The material covered in the book is accessible to working engineers with little or no explicit background in neural networks However the material is presented in sufficient depth so that those with prior knowledge will find this book beneficial Pattern Recognition with Neural Networks in C is also suitable for courses in neural networks at an advanced undergraduate or graduate level This book is valuable for academic as well as practical research Neural Networks for Pattern Recognition Albert Nigrin,1993 In a simple and accessible way it extends embedding field theory into areas of machine intelligence that have not been clearly dealt with before Neural Networks for Pattern Recognition takes the pioneering work in artificial neural networks by Stephen Grossberg and his colleagues to a new level In a simple and accessible way it extends embedding field theory into areas of machine intelligence that have not been clearly dealt with before Following a tutorial of existing neural networks for pattern classification Nigrin expands on these networks to present fundamentally new architectures that perform realtime pattern classification of embedded and synonymous patterns and that will aid in tasks

such as vision speech recognition sensor fusion and constraint satisfaction Nigrin presents the new architectures in two stages First he presents a network called Sonnet 1 that already achieves important properties such as the ability to learn and segment continuously varied input patterns in real time to process patterns in a context sensitive fashion and to learn new patterns without degrading existing categories He then removes simplifications inherent in Sonnet 1 and introduces radically new architectures These architectures have the power to classify patterns that may have similar meanings but that have different external appearances synonyms They also have been designed to represent patterns in a distributed fashion both in short term and long term memory

Neural Networks in Pattern Recognition and Their Applications Chi-hau Chen,1991 The revitalization of neural network research in the past few years has already had a great impact on research and development in pattern recognition and artificial intelligence Although neural network functions are not limited to pattern recognition there is no doubt that a renewed progress in pattern recognition and its applications now critically depends on neural networks This volume specially brings together outstanding original research papers in the area and aims to help the continued progress in pattern recognition and its applications

Carpenter, Stephen Grossberg, 1991 *Pattern Recognition by Self Organizing Neural Networks* presents the most recent advances in an area of research that is becoming vitally important in the fields of cognitive science, neuroscience, artificial intelligence, and neural networks in general. The 19 articles take up developments in competitive learning and computational maps, adaptive resonance theory, and specialized architectures and biological connections. Introductory survey articles provide a framework for understanding the many models involved in various approaches to studying neural networks. These are followed in Part 2 by articles that form the foundation for models of competitive learning and computational mapping, and recent articles by Kohonen applying them to problems in speech recognition and by Hecht Nielsen applying them to problems in designing adaptive lookup tables. Articles in Part 3 focus on adaptive resonance theory, ART networks, self-organizing pattern recognition systems whose top-down template feedback signals guarantee their stable learning in response to arbitrary sequences of input patterns. In Part 4, articles describe embedding ART modules into larger architectures and provide experimental evidence from neurophysiology, event-related potentials, and psychology that support the prediction that ART mechanisms exist in the brain. Contributors: J. P. Banquet, G. A. Carpenter, S. Grossberg, R. Hecht Nielsen, T. Kohonen, B. Kosko, T. W. Ryan, N. A. Schmajuk, W. Singer, D. Stork, C. von der Malsburg, C. L. Winter.

Advances In Pattern Recognition And Artificial Intelligence Marleah Blom, Nicola Nobile, Ching Yee Suen, 2021-11-16 This book includes reviewed papers by international scholars from the 2020 International Conference on Pattern Recognition and Artificial Intelligence held online. The papers have been expanded to provide more details specifically for the book. It is geared to promote ongoing interest and understanding about pattern recognition and artificial intelligence. Like the previous book in the series, this book covers a range of topics and illustrates potential areas where pattern recognition and artificial intelligence can be applied. It highlights, for example, how pattern recognition and artificial intelligence can be used to classify, predict, detect, and help promote further discoveries related to credit scores, criminal news, national elections, license plates, gender, personality characteristics, health, and more. Chapters include works centred on medical and financial applications as well as topics related to handwriting analysis and text processing, internet security, image analysis, database creation, neural networks, and deep learning. While the book is geared to promote interest from the general public, it may also be of interest to graduate students and researchers in the field.

Pattern Recognition Using Neural Networks Carl G. Looney, Department of Computer Science, Carl G. Looney, 1997 Pattern recognizers evolve across the sections into perceptrons, a layer of perceptrons, multiple layered perceptrons, functional link nets, and radial basis function networks. Other networks covered in the process are learning vector quantization networks, self-organizing maps, and recursive neural networks. Backpropagation is derived in complete detail for one and two hidden layers for both unipolar and bipolar sigmoid activation functions.
