■ The American Association for Artificial Intelligence (AAAI) held its 1994 Spring Symposium Series on 19-23 March at Stanford University, Stanford, California. This article contains summaries of 10 of the 11 symposia that were conducted: Applications of Computer Vision in Medical Image Processing; AI in Medicine: Interpreting Clinical Data; Believable Agents; Computational Organization Design; Decision-Theoretic Planning; Detecting and Resolving Errors in Manufacturing Systems; Goal-Driven Learning; Intelligent Multimedia; Multimodal Systems; Software Agents; and Toward Physical Interaction and Manipulation. Proceedings of most of the symposia are available as technical reports from AAAI.

Applications of Computer Vision in Medical Image Processing

There is a growing community of computer vision researchers who are working on medical applications. This interdisciplinary activity is in part application driven and related to the widespread proliferation of high-resolution medical imagers. It is also the result of increased interest by the medical community in image-based methods, especially in surgical applications and the study of the anatomical correlations of diseases in living subjects. The applied mathematical traditions of computer vision and robotics have proven useful in exploiting the rich information that is latent in high-resolution medical imagery.

Our symposium, which turned into a small conference, was attended by an exciting international mix of surgeons, medical researchers, computer scientists, and engineers representing prominent medical and tech-

nical institutions. A common theme that emerged in the workshop was that much of the work in the community is collaborative in nature because many players are needed to carry off a successful application.

The event opened with a keynote talk by Nicholas Ayache of INRIA. He discussed research tracks in computer vision applied to three-dimensional medical images, highlighting some of the similarities and differences with mainstream computer vision. He pointed out that worldwide, about \$8 billion each year is spent on medical image production, and about \$350 million each year is spent on medical image processing, with both areas growing rapidly.

The topics of the paper sessions included medical image understanding, medical image registration, image-guided surgery, anatomic modeling, medical image processing and analysis, magnetic resonance imaging, postprocessing of magnetic resonance data, and medical visualization. The quality of the presentations was consistently high.

The symposium included a poster session that was held to be successful, both technically and socially, by presenters and attendees alike. Another highlight of the workshop was a tour of the Robotics Laboratory that is part of Stanford University's Computer Science Department as well as the Stanford robotic radiosurgery system, which is an exciting development in medical robotics.

The level of enthusiasm at the workshop was high, perhaps because the event provided an avenue where medical computer vision was the main topic. Future directions for research in medical computer vision were the topic of a panel discussion led by Eric

Grimson of the Massachusetts Institute of Technology. A rousing interaction occurred in which there was general agreement that the field is exciting and growing. Consensus was reached that the level of interest was high enough to justify holding a similar event next spring in Nice, France (3-5 April), to be hosted by Ayache.

AI in Medicine: Interpreting Clinical Data

The subject of the AI in Medicine symposium was interpreting clinical data. In particular, the focus was on the development and application of AI technologies to the problems of interpreting and monitoring clinical data. Topics of interest ranged from real-time monitoring system design to knowledge discovery and machine learning. We distributed two data sets to participants in an effort to (1) emphasize the particular difficulties of managing real data acquired in clinical settings over more academic research issues and (2) provide standard data sets for two common clinical situations to allow researchers both a basis for methodological comparison and ease of access to those who are not familiar with the medical domain.

One of these data sets was collected in an intensive care unit on 1 patient over a course of 12 hours. This dense data set contained 120 K of data on approximately 30 variables and featured many idiosyncrasies common to real-world data: missing information, erroneous data, inaccuracies in time stamping, and so on. The other, sparse data set contained information on blood glucose levels, insulin dosage, and lifestyle data on 70 diabetic patients collected over periods of a few weeks to several months.

To our delight, most participants chose to exercise their methods on the provided data. However, even more pleasant was the finding that a few researchers decided to launch new projects based on the problems identified in the distributed data sets. The dense data set was more popular, possibly because problems such as

Research and Development in Intelligent Systems XXVI Richard Ellis, Miltos Petridis, 2009-10-28 The most common document formalisation for text classification is the vector space model founded on the bag of words phrases representation The main advantage of the vector space model is that it can readily be employed by classification algorithms However the bag of words phrases representation is suited to capturing only word phrase frequency structural and semantic information is ignored It has been established that structural information plays an important role in classification accuracy 14 An alternative to the bag of words phrases representation is a graph based representation which intuitively possesses much more expressive power However this representation introduces an additional level of complexity in that the calculation of the similarity between two graphs is significantly more computationally expensive than between two vectors see for example 16 Some work see for example 12 has been done on hybrid representations to capture both structural elements in the graph model and significant features using the vector model However the computational resources required to process this hybrid model are still extensive **ECAI 2000** European Coordinating Committee for Artificial Intelligence, 2000 This volume covers the whole spectrum of artificial intelligence including knowledge representation automated reasoning constraint based reasoning machine learning autonomous agents human language technology planning vision and robotics and AI aspects of uncertainty and of creativity The book further includes contributions on innovative application All contributions are peer reviewed by an international Programme Committee , **Logic Programming and Nonmonotonic Reasoning** Francesco Calimeri, Giovambattista Ianni, Mirosław Truszczyński, 2015-09-14 This volume contains the refereed proceedings of the 13th International Conference on Logic Programming and Nonmonotonic Reasoning LPNMR 2015 held in September 2015 in

The Logic of Knowledge Bases Hector J. Levesque, Gerhard Lakemeyer, 2001-02-15. This book describes in detail the relationship between symbolic representations of knowledge and abstract states of knowledge exploring along the way the foundations of knowledge, knowledge bases, knowledge based systems and knowledge representation and reasoning. The idea of knowledge bases lies at the heart of symbolic or traditional artificial intelligence. A knowledge based system decides how to act by running formal reasoning procedures over a body of explicitly represented knowledge, a knowledge base. The system is not programmed for specific tasks rather it is told what it needs to know and expected to infer the rest. This book is about the logic of such knowledge bases. It describes in detail the relationship between symbolic representations of knowledge and abstract states of knowledge exploring along the way the foundations of knowledge, knowledge bases, knowledge based systems and knowledge representation and reasoning. Assuming some familiarity with first order predicate logic, the book offers a new mathematical model of knowledge that is general and expressive yet more workable in practice than previous models. The book presents a style of semantic argument and formal analysis that would be cumbersome or completely impractical with other approaches. It also shows how to treat a knowledge base as an abstract data type completely specified in an abstract way by the knowledge level operations defined over it.
