

**Step 1: Identification of embryo type and developmental state**

A *Triodia* seed, that is encased by the floret, has a fully developed, lateral embryo type

**Step 2: Determine whether un-treated floret/seeds can take up water**

*Triodia* florets and seeds have a permeable coat that does not prevent water uptake.

**Step 3: Test seeds for germination over a wide temperature range**

Germination of un-treated, *Triodia* florets is low (dashed line). Germination of *Triodia* seeds (i.e. floret removed) is slightly higher and occurs over a wider temperature range (e.g. coloured bars: blue = water, green = gibberellic acid, red = amaranth water).

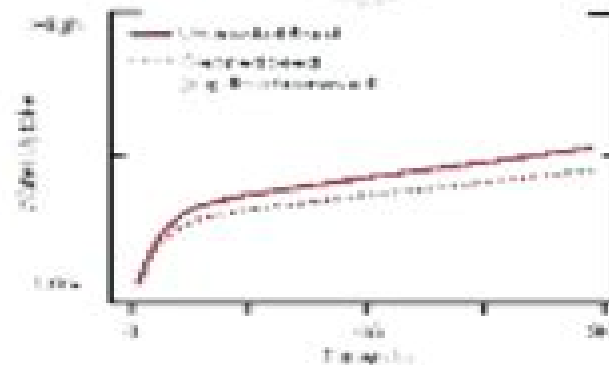

Fig. 2 – Seedling establishment of *Triodia* seeds is enhanced after the floret is removed and adequate rainfall is received (a). Once the initial recruitment bottleneck of germination and emergence are surpassed, *Triodia* plants survive and grow un-impaired for many years (b).

**Seeds** Carol C. Baskin, Jerry M. Baskin, 2001 *Seeds: Ecology, Biogeography, and Evolution of Dormancy and Germination* provides a working hypothesis of the ecological and environmental conditions under which various kinds of seed dormancy have developed. It also presents the seed germination of more than 3500 species of trees, shrubs, vines, and herbaceous species.

Stuart Chapin III, Thijs L. Pons, 2013-04-17 The individual is engaged in a struggle for existence (Darwin). That struggle may be of two kinds: The acquisition of the resources needed for establishment and growth from a sometimes hostile and meager environment, and the struggle with competing neighbors of the same or different

species In some ways we can define physiology and ecology in terms of these two kinds of struggles Plant ecology or plant sociology is centered on the relationships and interactions of species within communities and the way in which populations of a species are adapted to a characteristic range of environments Plant physiology is mostly concerned with the individual and its struggle with its environment At the outset of this book the authors give their definition of ecophysiology arriving at the conclusion that it is a point of view about physiology A point of view that is informed perhaps by knowledge of the real world outside the laboratory window A world in which shall we say the light intensity is much greater than the 2s 1 200 to 500lmol photons m used in too many environment chambers and one in which a constant 20 C day and night is a great rarity The standard conditions used in the laboratory are usually regarded as treatments Of course there is nothing wrong with this in principle one always needs a baseline when making comparisons The idea however that the laboratory control is the norm is false and can lead to misunderstanding and poor predictions of behavior **Best of Growing Edge** Amy Knutson,2000
