Redesigning The Molecules Of Life:

Redesigning the Molecules of Life Steven A. Benner, 2012-12-06 The organic chemist is rarely satisfied by a simple explanation of the reactivity of organic molecules. Rather, the chemist wants to go one step further to control the behavior of molecules by altering their structure in a controlled way. This is in fact a rather stringent definition of understanding as it requires the prediction of behavior from structure or structure from behavior. But it also places technical demands on the chemist. He must be able to synthesize the molecules he studies, characterize them at the atomic level of structural resolution, and then measure their behaviors to the precision that his explanation demands. Biological chemistry presents special problems in this regard. Although the tools for synthesis, purification, and structural characterization are now available for manipulating rather large biological macromolecules (proteins and nucleic acids), in particular, the theory supporting these manipulations is inadequate. We certainly do not know enough to control generally the behavior of biological macromolecules; still worse, it is not clear that we know enough to design synthetic molecules to expand our understanding about how reactivity in such biological macromolecules might be controlled. Starting from scratch, there are simply too many oligopeptides to make, starting from native proteins, there are simply too many structural mutations that might be introduced.

Lynden-Bell, Simon Conway Morris, John D. Barrow, John L. Finney, Charles Harper, 2010-05-21 Reflecting a rich technical and interdisciplinary exchange of ideas, Water and Life: The Unique Properties of H₂O focuses on the properties of water and its interaction with life. The book develops a variety of approaches that help to illuminate ways in which to address deeper questions with respect to the nature of the universe and our place within it. *Science in Society* 56 Dr. Mae-Wan Ho, Prof.

Size Limits of Very Small Microorganisms National Research Council, Division on Engineering and Physical Sciences, Space Studies Board, Commission on Physical Sciences, Mathematics, and Applications, Steering Group for the Workshop on Size Limits of Very Small Microorganisms, 1999-09-13

How small can a free living organism be On the surface this question is straightforward in principle the smallest cells can be identified and measured But understanding what factors determine this lower limit and addressing the host of other questions that follow on from this knowledge require a fundamental understanding of the chemistry and ecology of cellular life The recent report of evidence for life in a martian meteorite and the prospect of searching for biological signatures in intelligently chosen samples from Mars and elsewhere bring a new immediacy to such questions How do we recognize the morphological or chemical remnants of life in rocks deposited 4 billion years ago on another planet Are the empirical limits on cell size identified by observation on Earth applicable to life wherever it may occur or is minimum size a function of the particular chemistry of an individual planetary surface These questions formed the focus of a workshop on the size limits of very small organisms organized by the Steering Group for the Workshop on Size Limits of Very Small Microorganisms and held on October 22 and 23 1998 Eighteen invited panelists representing fields ranging from cell biology and molecular genetics to paleontology and mineralogy joined with an almost equal number of other participants in a wide ranging exploration of minimum cell size and the challenge of interpreting micro and nano scale features of sedimentary rocks found on Earth or elsewhere in the solar system This document contains the proceedings of that workshop It includes position papers presented by the individual panelists arranged by panel along with a summary for each of the four sessions of extensive roundtable discussions that involved the panelists as well as other workshop participants

About Life Paul S. Agutter, Denys N. Wheatley, 2007-03-06 Thanks to the popular media and to books by Dawkins Fortey Gould Margulis and other writers people are informed about many aspects of biology Everyone seems to know a little about evolution for example and about DNA and the possibilities good and bad afforded by research in molecular genetics Most people know some of the arguments for and against the likelihood of life on other planets And so on We are glad that these pieces of information have become so widely available However we do not assume any particular knowledge other than the most basic in this book Our aim is to address general questions rather than specific issues We want to enable our readers to join their disparate pieces of knowledge about biology together The most basic of these general questions and perhaps the most difficult can be expressed in beguilingly simple words What is life What does modern biology tell us about the essential differences between living organisms and the inanimate world An attempt to answer this question takes us on a journey through almost the whole of contemporary cell and molecular biology which occupies the first half of the book The journey is worth the effort The provisional answer we attain provides a coherent unifying context in which we can discuss evolution the origin of life extraterrestrial life the meaning of intelligence the evolution of the human brain and the nature of mind
