

by the authors. Comparing computations by both methods is the only way to provide an acceptable answer. Intuitively, it seems that the most accurate computations should result from using measured z values and computing $i_B q_B$ by trial-and-error from Eq. 19 for as many size ranges as possible.

Closure by Hsieh W. Shen⁴ and Cary S. Hung,⁵ M. ASCE

The writers thank Hubbell for his critical examination of their paper. In his first point, the discussor has correctly pointed out that Eq. 13 should read

$$r' = \frac{i'_s q'_s}{i_B q_B} = C(A, z) R(A', z, P); \quad \text{and} \quad r' = 0.216 \frac{(A)^{z-1}}{(1-A)^z} (PJ'_1 + J'_2)$$

The discussor's second point was about the values of b_2 . The writers used the depth integrated samples because of the lack of point suspension sediment data. We agree with the discussor about the possible error on the calculation of the z - ω relation due to the use of $\phi_*/2$ for the calculation of $i_B q_B$, as was used in the Modified Einstein Procedure. Burkham and Dawdy (9) have pointed out the revision needed in regard to the calculation of $i_B q_B$. This point should definitely be studied further, not only for the calculation of the z - ω relation but also for the entire procedure for the calculation of the total sediment load. If ample amounts of different sediment sizes are available in the suspended sediment samples, there is no question that the measured z for each sediment size should be used. Unfortunately, an insufficient amount of important sediment sizes were available in the depth integrated sampler, and, therefore, it was necessary to use a regression curve to determine the variation of z with sediment fall velocity. We have proposed that the Remodified Einstein Procedure use this regression relationship between z and fall velocity ω .

Fluvial Hydrodynamics Subhasish Dey, 2024-11-02 This revised second edition of the book presents an improvement of the original version in terms of recent research corrections and outline The state of the art in fluvial hydrodynamics can be examined only through a careful exploration of the theoretical development and applied engineering technology This second updated edition focuses since most up to date research findings in the field are presented on the research aspects that involve a comprehensive knowledge of sediment dynamics in turbulent flows It begins with the fundamentals of hydrodynamics and particle motion followed by turbulence characteristics related to sediment motion Sediment dynamics are described from a classical perspective by applying the mean bed shear approach and additionally incorporating a statistical description for the role of turbulence It is intended to design as a course textbook in graduate research level and a guide for the field engineers as well keeping up with modern technological developments One of the most important additions is that at the end of each chapter varieties of problems were given Therefore as a simple prerequisite the background of the readers should have a basic knowledge in hydraulics in undergraduate level and an understanding of fundamentals of calculus

Hydrology V.P. Singh,Bhishm Kumar,2012-12-06 Water is vital to life maintenance of ecological balance economic development and sustenance of civilization Planning and management of water resources and its optimal use are a matter of urgency for most countries of the world and even more so for India with a huge population Growing population and expanding economic activities exert increasing demands on water for varied needs domestic industrial agricultural power generation navigation recreation etc In India agriculture is the highest user of water The past three decades have witnessed numerous advances as well as have presented intriguing challenges and exciting opportunities in hydrology and water resources Compounding them has been the growing environmental consciousness Nowhere are these challenges more apparent than in India As we approach the twenty first century it is entirely fitting to take stock of what has been accomplished and what remains to be accomplished and what accomplishments are relevant with particular reference to Indian conditions *Distributed Hydrological Modelling* Michael B. Abbott,Jens Christian Refsgaard,2012-12-06 It is the task of the engineer as of any other professional person to do everything that is reasonably possible to analyse the difficulties with which his or her client is confronted and on this basis to design solutions and implement these in practice The distributed hydrological model is correspondingly the means for doing everything that is reasonably possible of mobilising as much data and testing it with as much knowledge as is economically feasible for the purpose of analysing problems and of designing and implementing remedial measures in the case of difficulties arising within the hydrological cycle Thus the aim of distributed hydrologic modelling is to make the fullest use of cartographic data of geological data of satellite data of stream discharge measurements of borehole data of observations of crops and other vegetation of historical records of floods and droughts and indeed of everything else that has ever been recorded or remembered and then to apply to this everything that is known about meteorology plant physiology soil physics hydrogeology sediment transport and everything else that is relevant within this context Of course no matter how much data we have and no matter how much we know it will never be enough to treat some problems and some situations but still we can aim in this way to do the best that we possibly can

Coleman,1981 The objective of this study is to develop a better understanding of the stochastic structure of the instantaneous boundary shear processes in open channel flows This report presents new measurements of some stochastic properties of boundary shear stress taken at points spaced over half the wetted perimeter of a smooth open channel under conditions of essentially constant aspect ratio and Reynolds number The

instantaneous boundary shear stress was measured with hot film sensors driven by constant temperature anemometers The anemometer signals were digitized and analyzed in a high speed computer The effects of position along the wetted perimeter on the statistical moments and the probabilistic distribution of the instantaneous boundary shear stress are discussed Author
