Propulsion Engineering Study For Smallscale Mars:

Propulsion Engineering Study for Small-Scale Mars Missions John Whitehead, 2005-01-01 Rocket propulsion options for small scale Mars missions are presented and compared particularly for the terminal landing maneuver and for sample return Mars landing has a low propulsive differential velocity requirement on a 1 minute time scale but at a high acceleration High thrust weight liquid rocket technologies or advanced pulse capable solids developed during the past decade for missile defense are therefore more appropriate for small Mars landers than are conventional space propulsion technologies The advanced liquid systems are characterized by compact lightweight thrusters having high chamber pressures and short lifetimes Blowdown or regulated pressure fed operation can satisfy the Mars landing requirement but hardware mass can be reduced by using pumps Aggressive terminal landing propulsion designs can enable post landing hop maneuvers for some surface mobility The Mars sample return mission requires a small high performance launcher having either solid motors or miniature pump fed engines Terminal propulsion for 100 kg Mars landers is within the realm of flight proven thruster designs but custom tankage is desirable Landers on a 10 kg scale also are feasible using technology that has been demonstrated but not previously flown in space The number of sources and the selection of components are extremely limited on this smallest scale so some customized hardware is required A key characteristic of kilogram scale propulsion is that gas jets are much lighter than liquid thrusters for reaction control The mass and volume of tanks for inert gas can be eliminated by systems which generate gas as needed from a liquid or a solid but these have virtually no space flight history Mars return propulsion is a major engineering challenge earth launch is the only previously solved propulsion problem requiring similar or greater performance Mars in situ propellant production is a promising concept which offers the potential to reduce the mass which must be transported from earth However the use of in situ propellants does not mitigate the difficulty of designing the return vehicle s propulsion system

Propulsion Engineering Study for Small-scale Mars Missions ,1995 **Weapons in Space** Aaron Bateman, 2024-05-07 A new and provocative take on the formerly classified history of accelerating superpower military competition in space in the late Cold War and beyond In March 1983 President Ronald Reagan shocked the world when he established the Strategic Defense Initiative SDI derisively known as Star Wars a space based missile defense program that aimed to protect the US from nuclear attack In Weapons in Space Aaron Bateman draws from recently declassified American European and Soviet documents to give an insightful account of SDI situating it within a new phase in the militarization of space after the superpower d tente fell apart in the 1970s In doing so Bateman reveals the largely secret role of military space technologies in late Cold War US defense strategy and foreign relations In contrast to existing narratives Weapons in Space shows how tension over the role of military space technologies in American statecraft was a central source of SDI s controversy even more so than questions of technical feasibility By detailing the participation of Western European countries in SDI research and development Bateman reframes space militarization in the

1970s and 1980s as an international phenomenon He further reveals that even though SDI did not come to fruition it obstructed diplomatic efforts to create new arms control limits in space Consequently Weapons in Space carries the legacy of SDI into the post Cold War era and shows how this controversial program continues to shape the global discourse about instability in space and the growing anxieties about a twenty first century space arms race *Government Reports*
