Protein Kinases In Blood Cell Function

Chi-Kuang Huang, Ramadan Sha'afi

Protein Kinases In Blood Cell Function:

Protein Kinases in Blood Cell Function Chi-Kuang Huang, Ramadan Sha'afi, 1993-02-22 Protein Kinases in Blood Cell Function provides an up to date comprehensive review of protein kinases in various types of blood cell function Blood cells discussed include T lymphocytes B lymphocytes platelets mast cells neutrophils and macrophages The book will interest pathologists physiologists oncologists hematologists leukocyte biologists and immunologists It will also benefit anyone interested in signal transduction and blood cell functions such as host defense hemostasis and immune response

Regulation of immune system cell functions by protein kinase C Noah Isakov, Amnon Altman, 2014-11-11 Members of the protein kinase C PKC family of Ser Thr kinases are encoded by nine distinct but closely related genes which give rise to more than 12 different protein isoforms via a mechanism of alternative RNA splicing Most PKC proteins are ubiquitously expressed and participate in a plethora of functions in most cell types A majority of PKC isoforms is also expressed in cells of the immune system in which they are involved in signal transduction downstream of a range of surface receptors including the antigen receptors on T and B lymphocytes PKC proteins are central to signal initiation and propagation and to the regulation of processes leading to immune cell proliferation differentiation homing and survival As a result PKC proteins directly impact on the quality and quantity of immune responses and indirectly on the host resistance to pathogens and tendency to develop immune deficiencies and autoimmune diseases A significant progress was made in recent years in understanding the regulation of PKC enzymes their mechanism of action and their role in determining immunocyte behavior This volume reviews the most significant contributions made in the field of immune cell regulation by PKC enzymes Several manuscripts are devoted to the role of distinct PKC isoforms in the regulation of selected immunocyte responses Additional manuscripts review more general mechanisms of regulation of PKC enzymes either by post translational modifications such as phosphorylation or controlled proteolysis or by interaction with different binding proteins that may alter the conformation activity and subcellular location of PKC Both types of mechanisms can introduce conformational changes in the molecule which may affect its ability to interact with cofactors ATP or substrates This topic will be followed by a discussion on the positive and negative impact of individual PKC isoforms on cell cycle regulation A second section of this volume concentrates on selected topics relevant to role of the novel PKC isoform PKC theta in T lymphocyte function PKC theta plays important and some non redundant roles in T cell activation and is a key isoform that recruits to the immunological synapse the surface membrane area in T cells that comes in direct contact with antigen presenting cells The immunological synapse is formed in T cells within seconds following the engagement of the TCR by a peptide bound MHC molecule on the surface of antigen presenting cells It serves as a platform for receptors adaptor proteins and effector molecules which assemble into multimolecular activation complexes required for signal transduction The unique ability of PKC theta to activate the NF κ B AP 1 and NF AT transcription factors is well established and recent studies contributed essential information on the

mechanisms involved in the recruitment of PKC theta to the center of the immunological synapse and the nature of its substrates and the role of their phosphorylated forms in signal transduction Additional review manuscripts will describe the unique behavior of PKC theta in regulatory T cells and its role in the regulation of other cell populations including those of the innate immune response This volume brings together leading experts from different disciplines that review the most recent discoveries and offer new perspectives on the contributions of PKC isoforms to biochemical processes and signaling events in different immune cell populations and their impact on the overall host immune response

Cellular Mechanisms in Airways Inflammation Clive P. Page, Katharine H. Banner, Domenico Spina, 2013-03-11 Airways inflammation is a complex biological phenomenon resulting from the recruitment and activation of numerous cell types Airways inflammation contributes to the pathophysiology of airways disease An understanding of the mechanisms that regulate inflammatory cell function is essential for the development of novel anti inflammatory drugs for the treatment of common respiratory diseases such as asthma and COPD This book provides a collection of valuable reviews on the major inflammatory cells involved in airways disease and examines the pharmacology of current anti inflammatory drugs used in the treatment of airways disease Moreover an insight into the development of emerging drug therapies is also highlighted This book is a must for the library of any researcher or clinician interested in the pathophysiology of airways disease

Mechanisms of Platelet Activation and Control Kalwant S. Authi, Steven P. Watson, Vijay V. Kakkar, 2012-12-06 Recent years have seen tremendous advances in our understanding of the molecular mechanism of platelet activation All aspects of signal transduction in platelets from the identification of surface receptors G proteins phospholipases protein kinases and phosphatases intracellular receptors for inositol phosphates the Ca²⁺ regulatory machinery cytoskeletal constituents to the control mechanism employing cyclic nucleotides has seen an explosion of information regarding their importance and for each constituent in the family of molecules to which they belong This information has been of interest to researchers across a wide spectrum of disciplines including biochemists pharmacologists cell biologists and clinicians In April 1992 an International Symposium bearing the name of this volume was organised at the Thrombosis Research Institute to bring together scientists from across the world whose common interest was the study of platelet activation and its regulation We were particularly encouraged by the positive response from our speakers and the participants their detailed contributions and the very lively discussions that took place throughout the two days of the symposium Almost every aspect of signal transduction in human platelets was represented Of the invited speakers twelve were from Europe including the U K eight from North America and one from Japan This volume is a compilation of chapters submitted by the speakers and represents a concise but informative picture of the present knowledge of the mechanisms of platelet activation and control
