

THE CONSEQUENCES OF ISCHAEMIA

The incidence rates of many heart concerns in wealthy countries, such as the United Kingdom, are declining. But tackling these concerns is still a stubborn challenge: ischaemic heart disease is the leading cause of death globally. The pathologies of heart conditions are complex and interwoven, but they often start with ischaemia.

Ischaemic heart disease (IHD)

The heart's arteries narrow owing to the build-up of fatty deposits called plaques, reducing blood flow to the heart muscle. How symptoms manifest depends on the severity of this ischaemia.

UK incidence of IHD (per 100,000 adults)*

Stable angina

Stable angina, which causes chest pain, affects about 10–12% of women and 12–14% of men aged 65–84 (ref. 2). The pain is the result of ischaemia in heart muscles and can be a warning sign of being at risk of a heart attack. But the condition can be managed with lifestyle changes.

Poor management

Myocardial infarction

Continued ischaemia causes plaques to rupture into the blood stream. The heart responds by forming a blood clot, which makes the ischaemia worse. Depleted oxygen supplies cause substantial cell death. The severity of the infarction, or heart attack, is mainly based on the extent of cell death.

UK incidence of myocardial infarction (per 100,000 adults)*

9 MILLION

deaths per year globally from ischaemic heart disease*

Atrial fibrillation

This is the most common problem associated with the heart's rhythm, and is characterized by an abnormally fast and irregular heartbeat. This form of arrhythmia is a major preventable cause of heart failure and cardiac arrest. Its growing incidence is driven by an ageing global population.

UK incidence of atrial fibrillation (per 100,000 adults)*

Heart failure

The damage caused by a heart attack can lead to the heart becoming swollen, leaving it unable to pump blood efficiently. Incidence of heart failure is falling, but many people have symptoms that could have been picked up before they needed to go to hospital*, suggesting a high number of undiagnosed cases in the community.

UK incidence rates of heart failure (per 100,000 adults)*

Cardiac arrest

If a heart attack causes cardiac arrest, the heart stops pumping blood, causing organs and tissues to die if cardiopulmonary resuscitation is not performed. In the United Kingdom, around 50,000 cardiac arrests happen out of hospital each year. Just 10% of people survive*.

Hellerstein, 1984 **Cardiac Rehabilitation** William Kraus, Steven Keteyian, 2007-06-15 The era of cardiac rehabilitation in the United States dates back at least thirty years when Herman Hellerstein at Case Western Reserve Andy Wallace at Duke and Ken Cooper in Dallas envisioned that a comprehensive lifestyle approach to the rehab itation and prevention of patients having had a cardiac event would potentially yield great benefits for the individual patient and the health care system Until that time the thought of vigorous exercise in the cardiac patient soon after an event was close to anathema One of us WEK was introduced to Herman Hellerstein in Cleveland in the late 1960 s when his father sought medical opinion from him for a cardiac condition WEK was introduced to Andy Wallace in 1979 by which time the latter had started a multidisciplinary geographically regional cardiac rehabilitation program at Duke based upon consultations with Hellerstein and Cooper By then cardiac rehab itation was progressing beyond the vision of

exercise only and since then the concept of cardiac rehabilitation has grown into the comprehensive multidisciplinary program that we know today and that we attempt to describe in this volume The practice of cardiac rehabilitation has grown and metamorphosed in the last thirty years in parallel with the growth and metamorphosis of the practice of card vascular medicine During the formative stages of cardiac rehabilitation the use of coronary care units was in its infancy The coronary artery bypass operation was less than ten years old The LIMA bypass had not been invented Psychological Approach to the Rehabilitation of Coronary Patients U. Stocksmeier,2012-12-06 The increasing frequency of coronary diseases the still insufficient results of prevention have brought physicians to try to reduce as much as possible the consequences of ischaemic heart disease Coronary units and new treatments have somewhat reduced the dramatic complications of the acute phase but after the latter evil effects of the disease remain at the physiological psychological and social level It is the aim of rehabilitation to analyze these problems to reduce them or to solve them whenever possible When this conception of complete coronary care took the lead the conditioning effects of heart disease and of immobilization on physical conditions were emphasized physical training programmes were prepared and their main lines and physiological effects are now fairly well known But it was soon obvious that the psychological problems raised by the patient and his environment are equally important Their approach is however much more difficult and their treatment particularly complex So the Council on Rehabilitation of the International Society of Cardiology is really grateful to Professor Dr HALHUBER and Dr Dr STOCKSMEIER for giving the opportunity to specialists to discuss together this particular aspect of coronary disease The discussions have been devoted to the methods of approaching the patient as well as to the therapeutic aspects and the role of psychologists in the rehabilitation programmes some papers have been devoted also to the possible role of the personality as a risk factor in the development of the disease *Cardiac Rehabilitation* Julian Bath,Gail Bohin,Christine Jones,Eve Scarle,2009-09-17 This easy to use manual provides a practical framework for a multidisciplinary team to deliver a successful cardiac rehabilitation programme Despite evidence that cardiac rehabilitation programmes reduce risk there is no standard for hospital based multidisciplinary programmes which are thus complex and costly to design and implement Based on the cardiac rehabilitation work that has been carried out at in Gloucestershire over the past fifteen years developing and constantly evaluating the evidence base for the programme Includes client handouts such as food and exercise diaries

Evangelische Akademie in Tutzing under the patronage of the International Society of Cardiology Council on Rehabilitation from Febr 12-14 1981 The purpose of the meeting on Current Problems in Cardiac Rehabilitation was to come closer to answering the questions posed in the following pages and to make some opinions about cardiac rehabilitation less controversial To comment briefly on the interesting question of why opinions in the field of cardiac rehabilitation seem more controversial than in other fields of cardiology we would like to propose the following explanation 1 Lack of personal experience and lack of special training in cardiac rehabilitation are a major source of misunderstandings and differences of vocabulary between cardiologists engaged in clinical practice and in rehabilitation 2 Emotional problems in accepting a new kind of partnership between coronary patients and their physicians and a nihilistic attitude towards therapy of behaviour play an important role in the scepticism of cardiologists 3 Fear of an expensive overmedication I Illich is another argument concerning rehabilitation
