Graphs and Homomorphisms Pavol Hell, Jaroslav Nešetřil, 2004-07-22 This is a book about graph homomorphisms Graph theory is now an established discipline but the study of graph homomorphisms has only recently begun to gain wide acceptance and interest The subject gives a useful perspective in areas such as graph reconstruction products fractional and circular colourings and has applications in complexity theory artificial intelligence telecommunication and most recently statistical physics Based on the authors lecture notes for graduate courses this book can be used as a textbook for a second course in graph theory at 4th year or master s level and has been used for courses at Simon Fraser University Vancouver Charles University Prague ETH Zurich and UFRJ Rio de Janeiro The exercises vary in difficulty The first few are usually intended to give the reader an opportunity to practice the concepts introduced in the chapter the later ones explore related concepts or even introduce new ones For the harder exercises hints and references are

provided The authors are well known for their research in this area and the book will be invaluable to graduate students and researchers alike **Introduction to Discrete Mathematics with ISETL** William E. Fenton,Ed Dubinsky,2012-12-06

Intended for first or second year undergraduates this introduction to discrete mathematics covers the usual topics of such a course but applies constructivist principles that promote indeed require active participation by the student Working with the programming language ISETL whose syntax is close to that of standard mathematical language the student constructs the concepts in her or his mind as a result of constructing them on the computer in the syntax of ISETL This dramatically different approach allows students to attempt to discover concepts in a Socratic dialog with the computer The discussion avoids the formal definition theorem approach and promotes active involvement by the reader by its questioning style An instructor using this text can expect a lively class whose students develop a deep conceptual understanding rather than simply manipulative skills Topics covered in this book include the propositional calculus operations on sets basic counting methods predicate calculus relations graphs functions and mathematical induction **Algorithmic Problem Solving**

Graph Neural Networks: Foundations, Frontiers, and Applications Lingfei Wu, Peng Cui, Jian Pei, Liang Zhao, 2022-01-03 Deep Learning models are at the core of artificial intelligence research today It is well known that deep learning techniques are disruptive for Euclidean data such as images or sequence data and not immediately applicable to graph structured data such as text This gap has driven a wave of research for deep learning on graphs including graph representation learning graph generation and graph classification The new neural network architectures on graph structured data graph neural networks GNNs in short have performed remarkably on these tasks demonstrated by applications in social networks bioinformatics and medical informatics Despite these successes GNNs still face many challenges ranging from the foundational methodologies to the theoretical understandings of the power of the graph representation learning This book provides a comprehensive introduction of GNNs It first discusses the goals of graph representation learning and then reviews the history current developments and future directions of GNNs The second part presents and reviews fundamental methods and theories concerning GNNs while the third part describes various frontiers that are built on the GNNs The book concludes with an overview of recent developments in a number of applications using GNNs This book is suitable for a wide audience including undergraduate and graduate students postdoctoral researchers professors and lecturers as well as industrial and government practitioners who are new to this area or who already have some basic background but want to learn more about advanced and promising techniques and applications *Selected Papers on Algebra and Topology* by Garrett Birkhoff J.S.

Oliveira,G.-C. Rota,1987-01-01 The present volume of reprints are what I consider to be my most interesting and influential papers on algebra and topology To tie them together and to place them in context I have supplemented them by a series of brief essays sketching their historical background as I see it In addition to these I have listed some subsequent papers by others which have further developed some of my key ideas The papers on universal algebra lattice theory and general topology collected in the present volume concern ideas which have become familiar to all working mathematicians It may be helpful to make them readily accessible in one volume I have tried in the introduction to each part to state the most significant features of each paper reprinted there and to indicate later developments The background that shaped and stimulated my early work on universal algebra lattice theory and topology may be of some interest As a Harvard undergraduate in 1928-32 I was encouraged to do independent reading and to write an original thesis My tutorial reading included de la Vallée Poussin's beautiful Cours d'Analyse Infinitésimale Hausdorff's Grundzüge der Mengenlehre and Fréchet's Espaces Abstraits In addition I discovered Carathéodory's 1912 paper Über das lineare Mass von Punktmengen and Hausdorff's 1919 paper on Dimension und Ausseres Mass and derived much inspiration from them A fragment of my thesis analyzing axiom systems for separable metrizable spaces was later published ² This background led to the work summarized in Part IV *Application of Graph Rewriting to Natural Language Processing* Guillaume Bonfante,Bruno Guillaume,Guy Perrier,2018-06-19

The paradigm of Graph Rewriting is used very little in the field of Natural Language Processing But graphs are a natural way of representing the deep syntax and the semantics of natural languages Deep syntax is an abstraction of syntactic dependencies towards semantics in the form of graphs and there is a compact way of representing the semantics in an underspecified logical framework also with graphs Then Graph Rewriting reconciles efficiency with linguistic readability for producing representations at some linguistic level by transformation of a neighbor level from raw text to surface syntax from surface syntax to deep syntax from deep syntax to underspecified logical semantics and conversely
