

DEVELOPING ASSESSMENT RELIABILITY AND VALIDITY: ITEM ANALYSIS

Readily available analysis techniques allow us to obtain sophisticated item analysis data for music items

Item Response Theory models should become the standard analysis approach

3 parameter models for dichotomous items which measure difficulty and discrimination while controlling for guessing

Polytomous generalized rating scale models extend IRT theory to the analysis of rubric-based assessments (i.e. Samejima's graded response model)

Easy software programs such as XCalibre4™ make these complex calculations accessible

Validity and Inter-Rater Reliability Testing of Quality Assessment Instruments U. S. Department of Health and Human Services, Agency for Healthcare Research and Quality, 2013-04-09

The internal validity of a study reflects the extent to which the design and conduct of the study have prevented biases. One of the key steps in a systematic review is assessment of a study's internal validity or potential for bias. This assessment serves to:

- 1 identify the strengths and limitations of the included studies
- 2 investigate and potentially explain heterogeneity in findings across different studies included in a systematic review
- 3 grade the strength of evidence for a given question

The risk of bias assessment directly informs one of four key domains considered when assessing the strength of evidence. With the increase in the number of published systematic reviews and development of systematic review methodology over the past 15 years, close attention has been paid to the methods for assessing internal validity. Until recently, this has been referred to as quality assessment or assessment of methodological quality. In this context, quality refers to the confidence that the trial design, conduct, and analysis has minimized or avoided biases in its treatment comparisons. To facilitate the assessment of methodological quality, a plethora of tools has emerged. Some of these tools were developed for specific study designs, e.g., randomized controlled trials (RCTs), cohort studies, case-control studies, while others were intended to be applied to a range of designs. The tools often incorporate characteristics that may be associated with bias; however, many tools also contain elements related to reporting, e.g., was the study population described and design, e.g., was a sample size calculation performed that are not related to bias. The Cochrane Collaboration recently developed a tool to assess the potential risk of bias in RCTs, The Risk of Bias (ROB) tool, was developed to address some of the shortcomings of existing quality assessment instruments, including over-reliance on reporting rather than methods. Several systematic reviews have catalogued and critiqued the numerous tools available to assess methodological quality or risk of bias of primary studies. In summary, few existing tools have undergone extensive inter-rater reliability or validity testing. Moreover, the focus of much of the tool development or testing that has been done has been on criterion or face validity. Therefore, it is unknown whether or to what extent the summary assessments based on these tools differentiate between studies with biased and unbiased results, i.e., studies that

may over or underestimate treatment effects There is a clear need for inter rater reliability testing of different tools in order to enhance consistency in their application and interpretation across different systematic reviews Further validity testing is essential to ensure that the tools being used can identify studies with biased results Finally there is a need to determine inter rater reliability and validity in order to support the uptake and use of individual tools that are recommended by the systematic review community and specifically the ROB tool within the Evidence based Practice Center EPC Program In this project we focused on two tools that are commonly used in systematic reviews The Cochrane ROB tool was designed for RCTs and is the instrument recommended by The Cochrane Collaboration for use in systematic reviews of RCTs The Newcastle Ottawa Scale is commonly used for nonrandomized studies specifically cohort and case control studies Measurement of Nursing Outcomes, 2nd Edition Louise Sherman Jenkins, PhD, RN, Dr. Carolyn F. Waltz, PhD, RN, FAAN, 2001-08-03 This is a compendium of over 30 tools for the measurement of professional and educational outcomes in nursing It is a second edition of the award winning series of books on measuring outcomes in nursing The tools and methods are presented with attention to purpose and utility conceptual basis development testing and reliability and validity assessments Major topic areas focus on clinical decision making and performance in education and practice student outcomes and research In most cases the complete measurement instrument is included in the book *Assessment of Couples and Families* Len Sperry, 2004-09-01 *Assessment of Couples and Families* considers the impact of recent changes on the assessment process and provide practitioners with a review of contemporary techniques and the means by which they can be implemented into practice in conjunction with new reporting inventories and observational methods These new assessment strategies will be presented collaterally with case material that addresses a specific problem such as family violence or marital suitability This unique problem focus will provide practitioners with a handy point of reference to acquaint themselves with modern practice techniques that address issues new to the therapy session while providing a supplement to coursework on assessment
