

Micromanipulation in Assisted Conception – A User's Manual and Troubleshooting Guide

Authors Steven D Fleming and Robert S King

The field of assisted conception is rapidly evolving with new techniques being developed and subsequently introduced into clinical practice. The success of these techniques largely depends on staff expertise and quality of equipment resources within the 'assisted conception' laboratory. Acquisition of micromanipulation techniques is an integral part of the embryologist's training. This book deals with assisted conception from a technical point of view. Nonetheless, it provides a great deal more than one would originally anticipate by just reading the book's title.

The initial impression is of a well-designed textbook. It comes in a superior quality print, which renders it attractive to the reader. There are plenty of photographs and illustrations, which facilitate understanding and practical problem solving. It is divided into chapters, each dealing with a different aspect of micromanipulation. It is the authors' intention for each chapter to stand on its own, so that the reader may directly access the chapter of interest. Glossary and abbreviation indexes are included, which is extremely helpful to readers not familiar with relevant terminology. Furthermore, a list of suppliers and manufacturers of equipment and consumables (including web addresses) is provided for professionals who are directly involved in the setting up and maintenance of an assisted conception unit. A troubleshooting section is included at the end of each chapter dealing with common technical problems encountered during performing micromanipulation techniques. Interestingly, this comes in a structured and uniform format, making troubleshooting a user-friendly process.

The content is presented in a clear and meticulous manner. The scientific knowledge

provided is supported by a combination of up-to-date literature evidence and the authors' longstanding experience in the field. The trainee embryologist can use the text as a walkthrough guide in setting up and 'tuning' laboratory equipment as well as learning to perform micromanipulation techniques. The senior embryologist will further explore the options currently available with regard to choice of technique, equipment and consumables, as a means to enhancing quality performance within the laboratory environment. The clinician with a special interest in assisted conception techniques will appreciate the implication of various techniques on reproductive outcome, obtain insight on managing couples with severe male factor infertility and receive up-to-date knowledge on new and advanced techniques, such as somatic cell nuclear transfer and embryo biopsy. Finally, the researcher who makes use of micromanipulation techniques will acquire useful tips on customising equipment for research purposes. Furthermore, novel DNA manipulation techniques, such as direct DNA microinjection or the use of DNA-transfected embryonic stem cells on animal (mice) models are described, in support of the extensive potential of micromanipulation techniques in studying gene regulation and introducing future therapeutic modalities.

In conclusion, this book, albeit a technical guide, is likely to benefit both clinicians and researchers working within the exciting field of assisted conception. It will undeniably be an invaluable tool for any professional contemplating the setting up and running of a modern 'assisted conception' laboratory. Its meticulous design, explicit writing style and practical analysis provide a reliable, hands-on manual on assisted conception micromanipulation techniques.
