Nutritional Improvement Of Food Legumes By Breeding

Endel Karmas, Robert S. Harris

Nutritional Improvement Of Food Legumes By Breeding:

Nutritional Improvement of Food and Feed Proteins Mendel Friedman, 2013-03-09 The nutritional quality of a protein depends on the proportion of its amino acids especially the essential amino acids their physiological availability and the specific requirements of the consumer Availability varies and depends on protein source interaction with other dietary components and the consumer's age and physiological state In many foods especially those from plants low levels of various essential amino acids limits their nutritive value This is particularly important for cereals which may be inadequate in the essential amino acids isoleucine lysine threonine and tryptophan and legumes which are often poor sources of methionine Moreover these commodities are principle sources of protein for much of the earth's rapidly growing population At the current annual growth rate of about 2 percent the world population of about 4 billion will increase to 6.5 billion by the year 2000 and to 17 billion by the year 2050 Five hundred million people are presently estimated to suffer protein malnutrition with about fifteen thousand daily deaths The ratio of malnourished to adequately nourished will almost surely increase For these reasons and especially in view of the limited availability of high quality largely animal protein to feed present and future populations improvement of food and feed quality is especially important

Nutritional Improvement of Food Legumes by Breeding Max Milner, 1973 **Integrated Improvement of Food Legumes** Aditya Pratap, Chandra Mohan Singh, Deepak Kumar Verma, Awdhesh Kumar Mishra, 2025-06-05 Grain legumes provide an excellent source of dietary protein carbohydrates iron and zinc Their role in promoting human and soil health and environmental sustainability is appreciated by the global scientific communities Impressive research progress has been made on the development of improved varieties matching production and protection technologies biofortification and post harvest management of food legumes The genetic improvement has been due in large part to the advent of modern molecular and genomic technologies which have supplemented the traditional methods and classical breeding This book brings together a comprehensive knowledge resource on all such developments and provides information on next generations breeding approaches improvement of quality traits multiple stress resistance seed quality enhancement and post harvest processing and value addition in grain legumes It is intended to be a comprehensive guide to legume crops improvement and cultivation

Improvement of Nutritional Quality of Food Crops V. Silano, H. C. Bansal, Alessandro Bozzini, 1981-01-01

Nutritional Improvement of Foodlegumes By Breeding M. Milner, 1978 **Nutritional Evaluation of Food Processing** Endel Karmas, Robert S. Harris, 2012-12-06 Dramatic changes in the attitudes toward human nutrition have taken place during the past decade Food related and medical professionals as well as consumers are now more than ever before aware of and concerned about diet nutrition and the beneficial and deleterious effects of food processing upon nutrients The old saying We are what we eat is still relevant Nutritious food will contribute greatly to consumers good health and ultimately reduce medical bills Food processing is essential to maintaining our food reserves from one harvest to another

thus letting us serve our daily meals regularly If food processing is defined as including all treatments of foodstuffs from harvest to consumption then more than 95% of our food may be considered as processed In most cases food processing and storage cause some reduction in the nutritional value of foods Advances in food science and food technology have resulted in an increase in nutrient retention after processing In addition today's consumer better understands how to avoid excessive nutrient losses during food preparation The information presented in this completely revised reference and textbook will help the reader to understand better the relationship between food processing and nutrient retention The authors' scholarly contributions are greatly appreciated *Food and Feed from Legumes and Oilseeds* J. Smartt, Emmanuel

Nwokolo, 2012-12-06 Oilseeds and legumes provide a significant proportion of the protein and energy requirements of the world population This important new book provides comprehensive details of the main oil seed and legume crops focusing particularly on the nutritional aspects of these crops which are or have the potential to be more widely exploited in developing countries where are or have the potential to be more widely exploited in developing countries where protein and energy malnutrition continue to escalate The predicted rapid rise of populations in many world regions which are increasingly vulnerable to food shortages means that a full knowledge of the nutritional significance of available crops is vital in helping to prevent potential calamities Food and Feed from Legumes and Oil Seeds has been written by a team of international contributors each with direct experience of these important crops and their nutritional merits and the editors are both international experts in the crops covered This book will become of great value to nutritionists food and feed scientists and technologists agricultural scientists and all those involved with overseas developments and food aid organizations **Breeding for Enhanced Nutrition and Bio-Active Compounds in Food Legumes** Debjyoti Sen

Gupta, Sanjeev Gupta, Jitendra Kumar, 2021-01-18 More than 20 million childhood deaths occur every year due to the micronutrient deficiency and diet related non communicable diseases cardiovascular diseases cancers chronic respiratory diseases and diabetes The United Nations UN recently announced that the increase in chronic non communicable diseases has resulted in 36 million deaths around the world annually claiming more lives than all other causes combined These chronic diseases are not isolated to developed countries and are even more pronounced in the developing world Such chronic illnesses have caused far more deaths than infectious diseases throughout the world except Africa in recent years Therefore enrichment of micronutrients in staple food crops is of paramount importance for the nutritional security in our world Biofortification is the development of micronutrient and or vitamin rich crops using traditional crop improvement practices as well as modern biotechnology tools It is a more sustainable and cost effective method than food supplementation fortification and diet diversification This work consolidates available information on the different aspects of breeding for improved nutrition of pulses An overview of entire pulses based on their nutritional profile is given so that audience can find the desired information easily Food legumes are the active ingredients in many gluten free food products and there is a

continuous rise of the use of pulses flour in milling and baking processes Our book sheds light on recent efforts and the underlying constraints of meeting the public demand We believe this work provides the basic information for anyone interested in biofortification and stimulate further research to meet this unique challenge *Legumes in Human Nutrition* Wallace Ruddell Aykroyd, Joyce Doughty, Ann F. Walker, 1982-01-01 bibliog pp 123 152 Plant Breeding Reviews J. Janick, 2012-12-06 Plant breeding the domestication and systematic improvement of crop species is the basis of past and present agriculture Our so called primitive progenitors selected practically all our present day crop plants and the improvement wrought through millenia of selection has so changed some of them that in many cases their links to the past have been obliterated There is no doubt that this ranks among the greatest of human achievements Although plant breeding has been a continuous empirical activity for as long as humans have forsaken the vagaries and thrill of hunting for the security and toil of agriculture genetic crop improvement is now very much of a twentieth century discipline Its scientific underpinnings date to the beginning of this century with the discovery of Gregor Mendel s classic 1865 paper on the inheritance of seven characters in the garden pea If any science can be traced to single event the best example is surely found in the conception of modern genetics that appears in this single creative work The relationship of plant breeding progress to advances in genetics has become closely entwined Mendel himself was concerned with crop improvement and worked on schemes for apple and pear breeding Plant breeding also has claims on other scientific and agricultural disciplines botany plant pathology biochemistry statistics taxonomy entomology and cytology to name a few and has also impinged on our social ethical economic and political consciousness
